BEFORE THE
ILLINOIS COMMERCE COMMISSION
POLICY SESSION
BUSINESS INVESTMENTS IN CLOUD COMPUTING
ARRANGEMENTS

Thursday, September 24, 2015
Chicago, Illinois

Met, pursuant to notice, at 8:30 A.M.,
at 160 North La Salle Street, Chicago, Illinois.

- PRESENT:
- BRIEN J. SHEAHAN, Chairman
 - ANN MCCABE, Commissioner
 - SHERINA E. MAYE, Commissioner
 - MIGUEL DEL VALLE, Commissioner
 - JOHN R. ROSALES, Commissioner

SULLIVAN REPORTING COMPANY, by
PATRICIA WESLEY

1 CHAIRMAN SHEAHAN: I would like to ask everyone
2 to take a seat and we will get started. Welcome to
3 the Illinois Commerce Commission's Policy Session
4 regarding Business Investments in Cloud Computing
5 Arrangements.

6 This session is convened pursuant to
7 the Illinois Open Meetings Act, and our guests and
8 panelists should be aware that a court reporter is
9 present. A transcript of this session, along with
10 audio and video, will also be available on the
11 Commission's website soon.

12 With us are Commissioners McCabe,
13 del Valle, Maye and Rosales. A quorum is present.

14 I would like to thank today's
15 panelists for the effort that they have put into the
16 presentations and to all of you for taking the time
17 to attend.

18 I would like to offer special thanks
19 to Tom Seibel, CEO and Chairman of C3 Energy, for
20 joining us today. Tom has been an innovator and
21 leader in information technology for 40 years, and
22 we appreciate your time and your interest in this

1 topic.

2 The purpose of today's session is to
3 discuss technology advancements in energy analytics
4 and Cloud Computing Arrangements, including the
5 regulatory treatment of such arrangements as capital
6 expenses versus operating expenses under current
7 accounting guidelines.

8 Given that this topic has manifested
9 itself in an updated FASB Standard and legislation
10 in the U.S. House of Representatives, the time is
11 ripe for the Commission to host a strategic
12 conversation.

13 My hope is that this session will help
14 develop a consensus around how to incentivize
15 utilities to adopt technologies that will result in
16 increased value for ratepayers, shareholders, and
17 the environment.

18 Today the Internet has a tremendous
19 effect on the way business is transacted.
20 Everything is happening faster, cheaper, and is more
21 integrated. The workforce is becoming more mobile
22 and product cycles are becoming shorter. These

1 changes are driving increased complexity and scale
2 and result in a need for massive Cloud computing
3 resources.

4 In the simplest terms, Cloud computing
5 means storing and accessing data and programs over
6 the Internet instead of using on-premises systems.
7 Cloud computing arrangements continue to gain
8 acceptance in corporate IT departments and are
9 becoming a key element in businesses' ability to
10 deliver IT services securely, reliably, and at
11 scale. It's not surprising that high numbers of
12 companies are migrating to the cloud for cost
13 savings, increased flexibility and, greater
14 ease-of-use.

15 The most common Cloud computing models
16 are Software-as-a service, where businesses
17 subscribe to applications accessible over the
18 Internet; Platform-as-a Service, where customers
19 develop, run, and manage applications on-line; and
20 an Infrastructure-as-a Service, where providers like
21 Amazon, Microsoft, and Google provide a backbone
22 that can be "rented out" to other companies.

1 Software-as-a-Service arrangements are now
2 outselling traditionally-licensed software, and
3 Cloud computing is winning corporate converts every
4 day.

5 According to Rightscale's fourth
6 annual State-of-the Cloud Survey, 82 percent of
7 enterprises have a Cloud strategy. According to
8 Google, 3,000 businesses a day move to the Cloud and
9 more than 3 million have moved into the Cloud since
10 the Cloud's debut in 2007.

11 In the startup world, Cloud adoption
12 is reaching a hundred percent when a company is
13 building a product or service that will rely on
14 technology infrastructure. It's becoming a rare
15 instance when companies are spending capital on
16 servers and data centers and it will become rarer in
17 the future.

18 The same cannot be said, however, for
19 utilities burdened by outdated regulations that
20 cause the rate of Cloud adoption to be relatively
21 low. The rapid growth of hardware investments in
22 the smart grid presents an opportunity for utilities

1 to take full advantage of Cloud computing and
2 leverage the value of the modern grid.

3 According to Navigant, the next decade
4 utilities will invest billions to make the devices
5 that power the grid remotely IP addressable,
6 including, for example, the nearly 1.1 billion smart
7 meters that are projected to be installed by 2022.

8 Nevertheless, current regulations and
9 accounting rules impede the ability of utilities and
10 ratepayers to benefit from new IT models by
11 classifying investments in legacy hardware and
12 supporting on-premise software as a "capital
13 expense" while classifying investments in
14 cloud-based technologies as an "operating expense"
15 for which a rate of return is not offered.

16 This distinct accounting treatment
17 creates a perverse incentive for companies to pursue
18 more costly, and less effective, and riskier
19 on-premise technology investments, ultimately
20 depriving ratepayers of the immense performance and
21 economic benefits offered by more advanced
22 technology innovations that other industry sectors

1 are now utilizing.

2 With both the utility industry and
3 technology evolving rapidly, it's time for
4 regulators to adapt more quickly and to embrace
5 opportunities that come with being technology
6 enablers. Instead of utilities being restrained by
7 outdated accounting rules, regulations need to catch
8 up with technological innovations to accelerate the
9 goal of a modern transmission and distribution
10 system that benefits ratepayers, shareholders and
11 the environment.

12 Utilities should not be
13 dis-incentivized from investing in technology but
14 instead should be leading the way in the use of more
15 reliable and more efficient systems. As regulators,
16 we must understand the issues at stake and create
17 rules that support utilities in ways that deliver
18 greater benefits to ratepayers and stakeholders
19 alike.

20 The discussion among regulatory
21 agencies on how to evaluate these new technologies
22 must be forward thinking given their potential to

1 significantly improve system performance, reduce
2 capital and operating costs and produce economic and
3 environmental value for the customers and utilities.

4 All stakeholders need to evaluate the
5 true economic impact of the industry's capital cost
6 recovery model and determine whether it's
7 appropriate given the accelerating pace of change in
8 technology and the value it can generate.

9 Each of us here today can contribute
10 to the goal of being technology enablers by helping
11 to think about reasonable solutions that regulators
12 can consider moving forward.

13 We look forward to hearing from all
14 perspectives about advances in cloud-based
15 arrangements, how they can be utilized by the energy
16 industry, and the cost-benefit considerations that
17 exist with these new technologies.

18 To begin, our first panel will consist
19 of brief presentations by companies utilizing
20 developing cloud-based -- that use and develop
21 cloud-based arrangements.

22 The purpose of the presentations is to

1 provide an overview of the advances in energy,
2 analytics and cloud arrangements in preparation for
3 a discussion on how these technologies can add value
4 and what steps are required for regulators to keep
5 pace with innovation.

6 To moderate the panel, I would like to
7 introduce Jay Hines-Shah. Jay currently serves as
8 the General Counsel and Ethics Officer for the
9 Illinois Commerce Commission. Please join me in
10 welcoming Jay.

11 (Applause.)

12 MR. HINES-SHAH: Thank you, Chairman.

13 As the Chairman said, my name is Jay
14 Hines-Shah.

15 (A brief pause.)

16 Sorry about that. Like the Chairman
17 said, my name is Jay Hines-Shah -- after figuring
18 out how to work the microphone -- I will be the
19 moderator for the first panel. This panel focuses
20 on the different types of Cloud computing software
21 technologies and how they can benefit customers.

22 The format of the panel will be

1 comprised of 10-minute presentations by seven
2 different persons who will speak for their company's
3 cloud-based technologies for their specific use of
4 the Cloud. We will hold questions until the end of
5 the presentations.

6 So to kick things off, first we have
7 Tom Seibel. Tom is Chairman and Chief Executive
8 Officer of C3 Energy, a Smart Grid analytic software
9 company. Please join me in welcoming Tom.

10 (Applause.)

11 MR. SEIBEL: Thank you, Mr. Chairman,
12 Commissioners, Ladies and Gentlemen. My name is Tom
13 Seibel and I am here from Silicon Valley, although I
14 grew up right here in Cook County. I'm a graduate
15 of the University of Illinois where I studied
16 computer science.

17 I have been active in the information
18 technology industry now for decades in building
19 companies, including Oracle, a company called Siebel
20 Systems, and a customer agent as we think about it
21 today. I have spent the last seven years involved
22 in a project called "C3 Energy," which is about

1 bringing this new generation of technologies to bear
2 on the energy value chain.

3 So I have seen transitions from
4 mainframe computing to mini-computing, to personal
5 computing, to Internet computing, and in every one
6 of these it has been an entire replacement market --
7 as we made the transition -- enterprise software
8 relational database -- and as we made the
9 transition, I have seen the industry grow from a
10 very small business worldwide to the order of about
11 a \$4 trillion business worldwide today, just about a
12 third the size of the U.S. GNP.

13 And as we made these transitions from
14 one technology to the other, I can assure you
15 everybody had all the reasons why they would never
16 need a new computer, because they already had an IBM
17 370, okay, and they would never use a personal
18 computer like possibly Zap, Gate, and SAP
19 application software of Oracle, and we would have to
20 hire them to build it for us. Okay.

21 And so at every stage we have had
22 people who were not going to make the transition and

1 at every stage these were entire replacement
2 markets, and we are on the verge of an entire
3 replacement market now, and so I will be talking
4 about the economics of that a little bit.

5 So what we have been looking at are
6 some really new technologies that are coming out of
7 Silicon Valley. They're coming out of Seattle. All
8 innovation in the 21st Century is happening in
9 basically Cloud-based computing. This is your
10 Google, Facebook, Microsoft, Oracle, SAP, C3 Energy.
11 There is very little investment being put in 20th
12 Century technology.

13 (Slide presentation.)

14 I will switch here.

15 CHAIRMAN SHEAHAN: Tom, why don't you kind of
16 talk through it and we will get this.

17 MR. SEIBEL: Okay. So, if we look at the
18 value -- okay. So if we look at the value chain --
19 to belabor the obvious for a moment, okay, when we
20 look at the traditional value chain of the utility
21 industry, we have generation, transmission,
22 distribution, metering, customer-care advantages,

1 and utilities all around the world tend to deal with
2 each of these.

3 (Slide presentation
4 delayed.)

5 Do you want my computer?

6 I remember when I was with Oracle in
7 1983 there were 20 people there and I had just
8 graduated from the University of Illinois and worked
9 in Chicago for that first year and then went to
10 Washington D. C. where I managed sales for Penn
11 State on behalf of the government -- on behalf of
12 the federal government.

13 And giving a presentation to the Board
14 of the Federal Reserve, you can't imagine what the
15 boardroom of the Federal Reserve looks like today,
16 and, I mean, you have like, you know, a window up
17 there with, you know, the eye of God, stuff like
18 that. You couldn't possibly imagine.

19 (Laughter.)

20 Back then. We used to give
21 presentations -- remember those carousels with the
22 little slides that broke? Presentations at the

1 Federal Reserve with slides was the most terrifying
2 thing in the world. We don't need the slides. I
3 will get this thing back on schedule, I assure you.

4 Okay. So let's think about the value
5 chain while these guys respond to the presentation.

6 Okay. We all know what it looks like worldwide.

7 It's largely recognizable by Edison and
8 Westinghouse, and pretty much all of the utilities
9 in the world tend to run -- whether they're fully
10 integrated or not, okay, they tend to run each of
11 these businesses as silos.

12 We have a generation business, a
13 transmission business, a distribution business, a
14 metering business, and recently a customer-care
15 business. Okay. As you know, very frequently each
16 of these silos report at the level of the CEO and
17 there's not a lot of communication across these
18 channels.

19 In response, to meet the needs of each
20 of these -- I wish I could work that slide show
21 now -- divisions, you know, the operations -- the
22 information technology industry has been providing

1 software that do things like meter data management,
2 customer care and billing.

3 I think we are almost there. Go back
4 to the first slide. Next.

5 (Laughter.)

6 So this is what the value chain looks
7 like.

8 Next slide, please.

9 Okay. And the industry has responded
10 in Siemens and General Electric, SAP, Oracle, okay,
11 meter data management systems, customer care and
12 billing systems, outage management systems,
13 generation management systems to meet the needs of
14 each of these silos.

15 The way that enterprise software
16 works -- and this is all -- this is all the type of
17 technology that we have developed in the last
18 century -- okay, but the way that these systems work
19 is they tend not to share data. There's a lot of
20 reasons for that that we don't need to get into
21 right now, but they don't share data.

22 Now this value chain is -- they don't

1 do it on purpose. They don't do it because of
2 circumstances, but it's very difficult to share data
3 across these systems.

4 Now this value chain -- next slide
5 please -- is going through an update -- upgrade this
6 decade where all of these devices are becoming
7 remotely machine addressable.

8 Now the data, Mr. Chairman, if you
9 look worldwide, if we look at the investment in this
10 entire value chain, I'm talking about the
11 industrialized world, including China, this looks to
12 be a \$2 trillion investment this decade. Okay.
13 This is not simply smart meters where we are talking
14 about building into smart meters. I would say Smart
15 Meters are not the interesting part.

16 So we are sensoring the entire value
17 chain, the thermostat, the variable C-pen at
18 Wal-Mart, the neider, okay, the Step-Up Transformer,
19 the Step-Down Transformer, the synchrophasor, the
20 pressure sensor on the Coal Tar Power Plant, the
21 vibration sensor on the nuclear power plant, and we
22 are sensoring all of these systems so that we can

1 remote each sensor in near real-time.

2 Now when we do this, a couple of
3 things happen. Okay. So this begins to
4 look -- next slide. So below -- you know, the
5 systems below -- next slide, please. Sorry.
6 Previous slide. I couldn't see that. Thanks.

7 Okay. Now we are there.

8 The systems kind of below this line
9 have been benefitting from the -- from what we call
10 "Morris Law," okay, where basically the power bases
11 have been increasing energy, increasing power. Now
12 when we sensor this entire core, it gets to look like
13 a fully-connected sensor network.

14 Bob Metcalfe, who some of you will
15 remember, and he was at Xerox PARC, he invented a
16 thing called Ethernet which turned out to be pretty
17 useful with an outfit called 3Com and now
18 Hewlett-Packard, if they still exist, and he sent --
19 this looks like a fully-connected sensor network,
20 but the power of this network is basically the
21 function of the square of the sensors in the
22 network.

1 And so now we can look across the
2 entire value chain in real-time and do things that
3 are pretty remarkable. Now I won't argue that these
4 smart meters, these sensors do nothing in and of
5 themselves without a software program.

6 So we spent the last seven years or
7 thereabouts now, I guess a quarter of a million
8 dollars -- next slide -- building a technology
9 platform -- next slide -- okay -- that allows a
10 utility operator, a grid operator, to take the union
11 of the data from all the operational systems,
12 transmission systems, distribution systems, customer
13 care and billing systems, okay, from within the
14 enterprise and from the extraprise, and that
15 includes weather, social media, Twitter feeds,
16 weather forecasts, predictions for solar radiation,
17 okay, and aggregate those data into a unified
18 federated cloud unit.

19 Okay. We load these data into the
20 Cloud at the rate of 6-1/2 billion transactions an
21 hour in a couple of use cases and then adjacent to
22 that we have an analytics segment, and aggregating

1 these different sources of data into a unified
2 federal database is an incredibly difficult
3 technical problem. We do this at scale to give you
4 a couple of use cases. And then with the analytics
5 that's also Cloud-based, we can slice and dice this
6 data every which way till Thursday and apply a
7 science called machine learning.

8 Okay. Machine learning is a new type
9 of algorithm that fell out of AMI, so we all know
10 what an algorithm is. An algorithm is a series of
11 steps that are generally pretty simple that a
12 computer will flow through repeatedly at high speed.
13 It does the same thing over and over again.

14 Machine learning is about algorithms
15 that get better and better every time we apply them
16 so we are able to look across the entire value chain
17 of real-time from the thermostat to the peaker
18 plant, to the capacity of units to whatever it may
19 be and basically see what's going on in real-time
20 and optimize the machine, the grid -- electric grids
21 as identified by the National Association of
22 Engineers as the most significant scientific

1 achievement in the 20th Century. Okay.

2 Now when we look at optimizing this
3 thing, mostly we look at the edgiest. We are
4 looking at different sources of energy on one end
5 and we are looking and trying to get people to
6 conserve energy on the other end.

7 What we are looking at now in using
8 these new technologies created a machine and we can
9 optimize the entire machine, and when we bring the
10 sciences of big data analytics and machine learning
11 to this machine, we can dramatically increase the
12 safety. We can increase the reliability. We can
13 lower the cost and lower the environmental impact of
14 power generation and transmission, and the benefits
15 are pretty significant.

16 So we manifest these -- when we bring
17 the meaning out of these data, we manifest it in
18 these applications that do things like revenue
19 protection. This is identifying them, using
20 analytics to identify them as a technical loss --
21 OPAR -- okay -- bringing OPAR into balance across a
22 grid infrastructure.

1 What's the benefit of OPAR? Okay.
2 The benefit of OPAR is high percent, less energy
3 gets burned to fuel the infrastructure. What's the
4 benefit to Commonwealth Edison of a non-technical
5 loss? Okay. Commonwealth Edison gave to the
6 consumers \$9.60 a year, okay, per meter, per unit.
7 That's 4 million a year. Pretty good. Pretty good
8 thing.

9 If you look across the entire grid --
10 infrastructure of a grid where we have literally
11 hundreds of millions of assets, and we can tell the
12 pen operator what device is most likely to fail?
13 What's the benefit of this? It's obvious, for
14 safety, for reliability, and also for the cost. The
15 economic benefit according to McKinsey & Company is
16 \$40 per meter fee.

17 So we invest in planning, customer
18 engagement, energy efficiency, demand response, grid
19 resilience, cyber security, the applications of
20 bringing it to the market.

21 Next slide.

22 And we have been installing these all

1 over the world, at Exelon, at GF, at NG, GF Labs,
2 and Enel. Now we will talk about particularly large
3 use cases in a minute here.

4 We are talking about Enel. Enel is a
5 hundred billion dollar -- a hundred billion Euro
6 utility based in Rome. There's 61 million meters in
7 40 countries.

8 Let me put this into perspective. In
9 the U.S. you have roughly a hundred million meters
10 support that are served by 3250 utilities, okay, and
11 now you have 61 million meters in 40 countries by
12 one utility using less energy, 81 million meters
13 supporting each of these companies are roughly the
14 size of the U.S. market.

15 So what we are doing -- the next
16 slide -- the applications -- the economic benefits
17 of this stack, okay, to ratepayers is about -- to
18 ratepayers at Commonwealth Edison, the ratepayers at
19 Exelon is -- according to the studies we have from
20 McKinsey & Company, a Boston consulting group -- is
21 on the order of \$300 per meter per year.

22 If you think of 4 million a year, this

1 is significantly about zero. If you get to the 61
2 million meters in the case of Enel, it is even more
3 a significant asset. And what are we doing there?
4 Enel's identifying -- telling them analytically
5 who's stealing energy and how are they stealing it.
6 Why is that important? Because everybody else has
7 to pay for it. Predictive maintenance, why is that
8 important? It's obvious. Customer engagement, why
9 is that important? It's obvious.

10 So we are doing predictive maintenance
11 for advanced information distribution assets. We
12 are doing predictive maintenance for renewable
13 generation assets, seven terawatts of renewable
14 generation assets.

15 By the way, in Enel, Italy, alone we
16 have 32 million smart meters that we have installed,
17 in Spain 12 million smart meters, and there are 50
18 million smart meters in Europe that were installed
19 at 44 million. We do predictive maintenance, that's
20 65 gigawatts of financial generation assets, and the
21 economic benefit from this entire stack is on the
22 order of -- I'm not making this up -- about a

1 billion Euros per year for these countries and their
2 customers.

3 So what happens is there are lower
4 energy bills. There's less energy consumed. We are
5 safer. The system is more reliable. It's more
6 resilient. It has lower costs and it has less
7 environmental impact.

8 Now why the Cloud? Let me tell you
9 about the size of the data image at Enel. For Enel,
10 Italy, we have aggregated 7 trillion rows of data
11 into 700 terabyte data images. This, Ladies and
12 Gentlemen, is bigger than a bread box. Okay. And
13 this is pretty big.

14 We are processing this, and this image
15 grows at a rate of 300 terabytes a day, and in order
16 for us to process these transactions at a rate of a
17 million-and-a-half transactions a second, this is
18 information technology. This is the equivalent of
19 getting about three angels dancing on the head of a
20 pin.

21 Now this could not be done behind the
22 firewall. It is technically impossible to do this

1 behind the firewall. We do this on 600 virtual
2 machines on two continents. So when we fire this
3 up, you know -- you know, the lights don't really
4 dim in Rome.

5 (Laughter.)

6 This is a computing infrastructure
7 that's inconceivable behind a firewall. It's the
8 type of technology that optimizes the grid
9 infrastructure and cannot be done behind the
10 firewall.

11 Now we are going to get to the
12 question of security of information, okay, you know,
13 of how secure is this information in the Cloud,
14 because if we look behind our own firewall, somehow
15 we feel safe. We have this illusion, this fiction,
16 that we can control this data and it's safe.

17 Ladies and Gentlemen, I mean, I would
18 argue the least secure place you could put this
19 information is behind our own firewall. I mean,
20 CNSA, okay, you know, the Department of State,
21 Office of Personnel Management for details, I'm
22 mean, how are they doing? I mean, if they can't

1 secure the data, what are utilities chances? Zero.

2 I think our colleagues, Microsoft and
3 other companies, would argue the most secure place
4 we can put this data is in Cyberspace. So these are
5 the types of systems that we are employing around
6 the world, relatively small scale systems, the
7 companies like Exelon, Mobil Gas & Electric and AMI
8 operations, large scale systems in Europe. And, you
9 know, where is this going with the Cloud?

10 Next slide.

11 Okay. In ten years -- in ten years
12 Exelon will not have a machine. They don't know
13 that yet. Okay. ICC will not have machinery. The
14 State of Illinois will not have machinery.
15 Computers will go away. You won't, just like you
16 don't have an idea of it. These things are going
17 away.

18 Let's look at ComEd to get more bang
19 for the buck. Let's look outside of Illinois.
20 Let's look outside of the United States and let's
21 look at the world.

22 Okay. We are doing business in China.

1 We are doing business in Japan. We are doing
2 business in Europe. We are doing business all over
3 America. The U.S. is trailing the world in
4 innovation as it relates to energy systems.

5 Okay. And let's look at quality of
6 power, and one indication of quality of power is the
7 SADIE score. SADIE is the number of minutes and
8 hours that a consumer is expected to use. Okay.

9 In 2013, the United States was a
10 representative year. It was 241 minutes. In 2014,
11 it was 203 minutes -- I can't see it. Okay. Okay.
12 Let's compare this to the rest of the world. In
13 Italy, it's 40 minutes. Okay. In Germany it's 15
14 minutes. In Japan -- next slide -- it's nine
15 minutes. Okay.

16 Ladies and Gentlemen, the quality of
17 service that we deliver to U. S. consumers is worse
18 in class in the industrialized world. There's only
19 one -- there's only one industrialized country
20 that's worse than the United States, and that is
21 Portugal, so we are looking at 2013 and 14, these
22 data are unimpeachable.

1 So I think that when you see these
2 news releases that come out -- and I'll get myself
3 in trouble again -- that we have, you know, the most
4 robust, the most modern, your know, energy
5 infrastructure on the planet, well, Ladies and
6 Gentlemen, what we are looking at is worse in class.
7 We need to face that. This is a solvable problem.

8 So I think that, you know, one of the
9 things that has been impeding this innovation was --
10 you know, I couldn't say it better than the Chairman
11 said it. He stole my presentation -- and basically
12 we are incentivizing our utilities in the United
13 States. They can invest in technology as long as
14 that technology was invented in the 19th or the 20th
15 Century, okay, and they have no incentive to invest
16 in 21st Century technology, unlike the financial
17 services industry, the healthcare industry, the
18 consumer advocacy industry.

19 So this is something that will solve
20 itself. It's just a question of how long it takes
21 to solve itself, but there is amazing -- we have
22 amazing opportunities out there, and these are very,

1 very exciting problems where we can increase safety,
2 increase reliability, lower the cost, lower the
3 environmental impact of this value chain.

4 Thank you for the opportunity.

5 MR. HINES-SHAH: Thank you so much, Tom.

6 Next we will hear from Dennis Garcia.

7 Dennis is an Assistant General Counsel for Microsoft
8 Corporation here in Chicago.

9 Please will you join me in welcoming
10 Dennis.

11 (Applause.)

12 MR. GARCIA: Well, thank you very much to the
13 Commission for inviting me here today.

14 (A brief pause.)

15 So I am not going to talk too much
16 about Microsoft. I am going to provide what I like
17 to call Cloud Computing 101 Overview. This is just
18 a basic level set of what the Cloud is all about.

19 Advance the slide, please.

20 I am not an engineer. I am not a
21 technical person. I am not a salesperson. I am a
22 lawyer, and I'm going to provide you with an

1 overview of Cloud computing from a lawyer's
2 perspective.

3 Please advance the slide.

4 I think a great place to start when
5 you are talking about the Cloud is to realize that
6 Cloud computing in many respects is not new
7 technology, and many of us have been using the Cloud
8 for a long time. Many of us have been using
9 web-enabled E-mail for years until the late 1990s
10 with the advent of the Internet.

11 I know I started out with an AOL.com
12 account. I moved to a Yahoo.com account, and when I
13 joined Microsoft, I had a Hotmail.com account, so we
14 have been using E-mail for years, and Cloud
15 computing powers E-mail technology.

16 We should also realize, whether we
17 like it or not, the Cloud is becoming ubiquitous in
18 our society. Many of us are using Smart phone
19 devices. A lot of data is generated in Smart
20 phones. All of that data, most of it, is stored in
21 the Cloud. Many of us use social media. We use
22 Facebook. We use LinkedIn. We use Twitter. I know

1 I use Facebook way too much. All of that is powered
2 by Cloud computing, so it's important for people to
3 realize just from a level set perspective.

4 In terms of the formal definition of
5 Cloud computing, there's no one formal definition
6 out there. There's lots of different definitions.
7 Back in 2011 the National Institute of Standards and
8 Technologies (NIST), part of the Department of
9 Commerce, came up with their view of how to define
10 Cloud computing.

11 Now I encourage everyone to take a
12 look at that definition. I've added it on Link.
13 It's not a white paper which contains that
14 definition. I'm not going to review that
15 definition. That definition is a little bit
16 complicated and involved for me, so I prefer this
17 definition.

18 Please move to the next slide.

19 This is a very straightforward simple
20 Cloud computing definition. Folks may say that it's
21 too simple, but I love it. Cloud is a fancy way of
22 saying stuff is not on your computer.

1
2

15
16
17
18
19
20
21
22

(Laughter.)

You may view that as being overly-simplistic, but I believe that really captures the essence of what the Cloud is all about. I actually found this definition in a Pennsylvania State Legal Ethics and Cloud Computing Opinion.

The Cloud computing is all about off-premise computing or remote computing, and what I mean by that is back in the day when I started working at Microsoft back in 2003, we were licensing our technology, Windows Office, as an example, to our customers, and those solutions resided on the device or the personal computers of those individuals. They downloaded that solution and it was resident on their device.

Many of our customers on-premise have these huge computer systems, server racks, server farms, mainframes. That's where they store their data, but the movement to the Cloud has really outsourced all of that technology to a third-party Cloud buyer who will manage that for you. You can now get computing devices to power your IT needs

1 through the Internet.

2 Please advance the slide.

3 Really what Cloud computing is all
4 about in essence are data centers. I don't know if
5 anyone has ever been to a data center. Data centers
6 are these massive facilities the size of football
7 fields which contain lots of computers, lots of
8 servers, which contain data and it's powering Cloud
9 provider technology to provide its services remotely
10 to customers.

11 On the right-hand side is an aerial
12 view of our data center located in the suburbs of
13 Chicago very close to O'Hare Airport. If anyone is
14 interested in taking a tour of our data centers, we
15 would be happy to accommodate you. It's a highly
16 secured environment, but we encourage our customers
17 to actually see the Cloud in action to see what a
18 data center is all about.

19 At Microsoft we have over a hundred
20 data centers based in 40 different countries and
21 many Cloud providers use secure data centers and
22 that's where data is flowing through. It's really

1 all about the data center.

2 Please advance to the next slide.

3 When you think about the Cloud, I like
4 to call this the big three of the Cloud. Generally
5 speaking, Cloud computing is provided through three
6 types of mechanisms: First, the most popular --
7 something that a Software-as-a-Service where a cloud
8 provider is providing their technology to you via
9 the Internet. All you need is an Internet
10 connection and you can get access to those services.
11 It's not stored on your device on-premise.

12 A great example of
13 Software-as-a-Service is Microsoft's Office's 365
14 Solution where you can get the Office products.
15 It's just by having access to the Internet and
16 locking in your credentials to the site.

17 A second example of cloud computing is
18 something known as infrastructure as a service, what
19 I call hardware as a service, whereby customers can
20 really rent hardware and computing power through a
21 third-party Cloud provider, and they can rent those
22 needs and acquire those needs as they need it. It's

1 highly scalable. A great example of
2 Infrastructure-as-a-service is Microsoft's Assure
3 Solution.

4 Finally, a third mode of Cloud
5 computing is something known as
6 Platform-as-a Service. These are probably more
7 germane to developers, developers of software for
8 web technologies, and providers of
9 Platform-as-a-Service really provide users with a
10 platform sandbox, if you will, computer sandbox
11 where you can create your applications or software
12 needs again using their remote solutions.

13 There's lots of benefits associated
14 with moving to the Cloud. I'm not going to go
15 through all of those benefits, but one of the key
16 benefits, which we message to our customers and
17 which our customers don't realize it, is that they
18 can save a lot of money moving to the Cloud.

19 If you move to the Cloud, you don't
20 need to have these massive servers, and mainframes,
21 and computers on-premises. You don't have to buy
22 them. You don't have to lease them. You don't have

1 to maintain them. You don't have to spend a lot of
2 money powering them up. You don't need to employ
3 folks to maintain them and to fix them.

4 So we tell our customers you stand to
5 gain a lot financially if you move to the Cloud.
6 This is a very attractive proposition for many of
7 our customers who are interested, of course, in
8 saving money.

9 We also believe that the Cloud can
10 improve your productivity. You can get any time
11 access on any device to key Cloud solutions. It
12 also allows you to really focus on your core
13 business. It allows you to get out of the IT
14 business, if you will, focus on your core business,
15 really serve your client and customers.

16 Then also, assuming that you are
17 working with what we like to call at Microsoft a
18 trusted Cloud provider, we believe that you can
19 enhance your security in moving to a company like
20 Microsoft. Quite frankly, we can secure your data a
21 lot better than many of our customers can on their
22 own.

1 We encourage our customers to really
2 take a look at our data center, understand our
3 compliance and security standards and our contracts
4 in terms of the level of detail which we take to
5 protect our customers' information.

6 Please advance the slide.

7 Now some folks will say that there are
8 concerns in moving to the Cloud and we hear them a
9 lot from our very important customers. Some
10 customers will say, well, I have security concerns
11 moving to the Cloud. I don't feel comfortable
12 entrusting my data and my customers' data, my
13 clients' data, other third-party data to another
14 third-party, and we understand that and we
15 appreciate that.

16 Some folks will say that Cloud
17 providers may be a bigger target for hackers.
18 There's also a perspective that moving to the Cloud
19 contains a bunch of hidden costs associated with
20 doing that. If you are a big enterprise and you
21 need to migrate a lot of data to the Cloud, it may
22 be timely. It may take a long time to do that. It

1 may be very expensive to migrate that data. So some
2 of our customers also raise various concerns which
3 we work in concert with them to address.

4 When you look at the Cloud provider
5 market today, I call it a very crowded Cloud
6 provider market. Cloud business has grown
7 exponentially. There's a lot of opportunity there,
8 but when I look at the market, I look at it as four
9 key segments. The first segment is the traditional
10 information technology providers, companies like my
11 company, companies like IBM, companies like Oracle.

12 A second category are these Cloud
13 providers who like to say that they were born in the
14 Cloud. I'm not sure exactly what "born in the
15 Cloud" means, but some examples of those companies
16 are Google, Amazon and Salesforce.com.

17 A third key category are these newer
18 marketplace entrants into the Cloud. They are
19 smaller companies. They have not been in the
20 business too long. Some of them make money and some
21 of them don't make money. Examples of those
22 companies are Box and Dropbox.

1 And then I think a fourth category are
2 these Cloud providers who perhaps were really never
3 information technologies-based. Perhaps they were
4 in a different industry, like the phone business and
5 telemarketing, and they decided to re-engineer their
6 business to provide Cloud solutions. For example,
7 those companies are Verizon and AT&T, so I hope that
8 provides you a perspective of the marketplace.

9 Go to the next slide, please.

10 One of my key takeaways from my
11 message today, obviously energy companies, utility
12 companies, deal with vitally sensitive and important
13 data. They provide mission-critical services to all
14 of us, so if they're going to move to the Cloud,
15 it's absolutely imperative that they have the goal
16 of also identifying what we like to call at
17 Microsoft a trusted Cloud provider, something which
18 our president and chief legal officer, Brad Smith,
19 likes to say time and time again. Nowadays
20 companies will only use technology if they feel
21 absolutely confident that they can trust it.

22 I will take it a step further. I tell

1 customers for whatever reason if they don't feel
2 that they can actually trust their Cloud provider
3 they shouldn't just walk away from that Cloud
4 provider, they should run away from that Cloud
5 provider.

6 May I have the next slide.

7 You may say, Dennis, that's great, but
8 how do I go off and find this so-called trusted
9 Cloud provider? And I know we are coming up against
10 time, so I'll just cover this at a very high level,
11 but we encourage our customers that if they are
12 moving to the Cloud that they should be focused on
13 what we call "four key pillars" in doing due
14 diligence in identifying this so-called "trusted
15 cloud provider."

16 The first pillar is in the area of
17 transparency. You want a Cloud provider that's
18 truly clear and transparent to you and the entire
19 marketplace with respect to their Cloud business
20 practices.

21 The second key pillar is in the area
22 of protection, data protection. You want to work

1 with a Cloud provider who really goes above and
2 beyond protecting your vitally important data. Of
3 course, it's not just your data, the data of your
4 clients, your customers, your vendors, your
5 partners, other key third parties.

6 The third key pillar is in the area of
7 compliance. You want to work with a Cloud provider
8 who should comply with certain key laws, key
9 standards, and hopefully provides a pathway for
10 companies to achieve their own compliance.

11 And the fourth key pillar is in the
12 area of control, data control. Although you are
13 entrusting a third-party Cloud provider to protect
14 your data in their data center, you want to make
15 sure that Cloud provider enables you to continue to
16 own and control that data.

17 Please advance the next slide.

18 I don't have a lot of time to go
19 through this, but what I put here is -- under each
20 pillar I put together a sort of a checklist of
21 various subcategories in consideration which
22 customers may want to take into account under each

1 of these pillars.

2 If you would advance the side.

3 Other subcategories for protection.

4 Please advance.

5 Other subcategories of compliance and

6 control.

7 Please advance.

8 I have also added in my personal top
9 ten contract terms which should be in any Cloud
10 contract between the customer and a Cloud provider.

11 Please advance.

12 And I have added some third-party
13 resources that you and your team may want to consult
14 to learn more about Cloud Computing, and this is my
15 contact information. That's what I have here, and I
16 appreciate your time.

17 (Applause.)

18 MR. HINES-SHAH: And thank you, Dennis.

19 Next up we have Todd Krause, Vice
20 President of Global Utility Sales at Enernoc
21 Corporation. Please join me in welcoming Todd
22 Krause.

1 (Applause.)

2 MR. KRAUSE: Thank you. Can you hear me okay?

3 I'll make sure I'm not too close to the mic. I know
4 not to do that, so I won't.

5 (Laughter.)

6 Thanks for the opportunity this
7 morning. It's great to be here in Chicago. It's
8 near and dear to me. I lived here early in my
9 career. It's great to be back here this time of the
10 year versus maybe a couple of months from now when
11 the conditions might get a bit different, so I'll be
12 very efficient this morning and cognizant of our
13 schedule, and I'm really going to talk about three
14 specific things. Number one I'm going to address
15 what I believe is happening in the energy industry.

16 There's a significant transformation
17 occurring, and I think it's important to be grounded
18 when we talk about this Cloud computing with why now
19 and what changes are happening in the broader energy
20 industry and utility landscape that actually dictate
21 that now is exactly the time this is so critical,
22 and then I want to speak very briefly about what

1 utilities are saying; why they're getting very
2 serious about how they serve customers; how their
3 efforts in the new formation of customer service
4 offers services within the utility construct, and so
5 we'll talk a little bit about that, and, finally,
6 I'll close with just a few words about Enernoc and
7 how we fit into the landscape.

8 So you might be looking at this slide
9 and saying, wow, what happens next, and I'll ask the
10 question where were you -- you don't have to answer
11 out loud -- on March 20th of this year?

12 If you were in Germany, you were in
13 the news with the topic of the fact that there was a
14 full solar eclipse, and in Germany, as Tom
15 referenced, they're ahead of us. They have a peak
16 demand in the German electric market about the unit
17 cable box. Just to give you a frame of reference,
18 it's about 3 1/2 times the size of ComEd and they
19 can serve up to 50 percent of that with solar
20 generation.

21 Well, if you get a full solar eclipse
22 and you are 50 percent relying on solar, it's hard

1 to say what's going to happen. That's exactly the
2 scenario that faced the four German TSOs on March
3 20th. It's really important to talk through this,
4 because it's a great example of where we are as a
5 world when it comes to the energy industry.

6 Now the great thing that happened is,
7 and a side note one of the TSOs actually shared with
8 me, that they approached March 20th similar to how
9 many companies approached Y2K back when we entered
10 the 2000s. They just didn't know what to expect, so
11 they were able to manage this thing very safely, but
12 a key component of the solution was Cloud-based
13 software solutions that helped on the demand side of
14 their generation and demand-side consumption stack
15 to help balance the grid and insure stability
16 through a very interesting event.

17 And I think it leads us to say, well,
18 how do we get here and where are we going? If you
19 look at -- Tom referenced the greatest development
20 in the 20th Century was the electric grid,
21 absolutely the case, but if you look at it from the
22 late 1800s to early 2000s, fundamentally it changed.

1 It focused on the concept of an incentive plan.
2 They have a distribution network in the name of the
3 consumers.

4 Next slide, please. It's hard to see,
5 but if you look forward ten years from today, it is
6 a very different world, and it is a very rapidly
7 changing world. It is a world that includes solar
8 generation. It includes battery storage, and it's
9 very, very quickly becoming affordable at an
10 end-user or residential or business level. It
11 includes electric vehicles, which are basically grid
12 tools on wheels. There's a massive transformation
13 happening and it is affecting no entity more than
14 it's affecting electric utilities.

15 Next slide, please.

16 So when we speak with utilities, which
17 we do every day, a lot of these issues that you see
18 on this slide are things that they're doing, which,
19 as a matter of fact, they're trying to figure out
20 how are we going to redefine who we are in this new
21 world -- in this new world of transformation that's
22 occurring.

1 Next slide.

2 And the thing that's at the very basic
3 level of driving transformation is that end users
4 have a choice. This is something utilities have
5 never dealt with, thus, the formation of customer
6 service organizations. They have choices in places
7 where it was never perceived that there would be
8 choice.

9 We are in Chicago, which is part of a
10 new energy market. Customers here apparently have
11 choice. There's parts of the U.S. where they don't,
12 but when you introduce the new technology, such as
13 PV storage, they do, and so it's a significant
14 transformation that is driving a new way of thinking
15 and it's driving the need for new tools.

16 Next slide, please.

17 That doesn't look right, but that's
18 okay.

19 (Laughter.)

20 MR. HINES-SHAH: I put that one in.

21 MR. KRAUSE: I like that.

22 Next slide. Pretend we didn't see it.

1

20
21
22

(Laughter.)

So what you see here is there's been studies done year over year of the utilities and energy retailers around the world, and those surveys are very, very interesting. They're telling with respect to what utilities are investing in, what they're thinking about, and, without question, they're trying to figure out how do we better serve these customers in a computer age? How do we engage customers that grew up with mobile devices in their hands? How do we achieve our goals as mandated by regulators in this new world?

The next thing to try to figure out, which is very related, is in a world where my customer cannot only be someone that buys a product from me, energy, for example, they might also produce energy that I want to buy back.

How do I build a relationship with them that allows us to exchange that product in a meaningful way? How do I become their trusted energy advisor.

So those are some of the high level

1 problems that utilities are trying to face. Those
2 are some of the transformative things that are
3 happening in the world that we are experiencing
4 today, and we have dealt with this before. There's
5 other industries where these problems have been
6 faced and solved. It's interesting.

7 I heard a great analogy recently at a
8 similar, but different, event. Look at the taxi
9 industry. If you think about the transportation
10 industry, typically what does a taxi think of when
11 they think of a customer? What's the term they use
12 to describe a customer? A fare, right? What does a
13 utility think of or describe a customer
14 historically? What do they call them?

15 COMMISSIONER MAYE: Ratepayers.

16 MR. KRAUSE: Exactly, ratepayers. Interject
17 technology, Uber. All of a sudden you have got this
18 highly-efficient mobile tool, two-way engagement,
19 whereby me, as a consumer, I rate the quality of
20 service I get.

21 Guess what? The service provider
22 rates the quality of the customer that I am and

1 makes the system much more efficient, utilities
2 again, going back to the concept of a customer
3 service order. They're no longer called customers.
4 They're ratepayers. They're saying we have
5 customers. We need to serve them. We know we need
6 to do it better and we need to do it more
7 efficiently, so those are the times that we are
8 experiencing. I think everyone on
9 this panel probably agrees with me. If they don't,
10 I look forward to that part of the panel. It will
11 be interesting. And where do we fit in this?

12 So Enernoc historically has been
13 around since about 2001 and we are most known for
14 demand response, and that's where we built the
15 company. That's where we're based, but over the
16 last many years we have taken our software
17 technology that built demand side networks.

18 In Chicago, for example, we have the
19 equivalent of several power plants just throughout
20 end-use sites that are connected to technologies
21 that if an energy shortfall develop, we can deploy
22 network operation centers and reduce the stress on

1 the electric grid.

2 We've taken that technology to expand
3 it to allow us to serve a much broader business base
4 and answer some of these key questions that
5 utilities are asking, and I think it's unique for us
6 and it's fair to comment that we have chosen to
7 focus very deeply on business customers, so your C&I
8 and small, medium businesses in which there are
9 many.

10 The reason for that is we think
11 through our technology platform and our knowledge of
12 end-use customers, that we serve both utilities and
13 end-users equally, that we can develop significant
14 value to all the parties.

15 Next slide.

16 We do this pretty simply all in the
17 Cloud. We have developed a platform that can serve
18 all classes of customers, and this includes not only
19 better serving utility customers throughout their
20 various segments, it also includes delivering
21 significant value back to the utilities in terms of
22 efficiency within their operation.

(Next slide.)

I'm not going to dwell on these in the interest of time, but what we see is very exciting and what we are thrilled about is the data access that's existing and ever increasing day over day.

Tom mentioned AMI. AMI is a wonderful data source. We are seeing though that beyond AMI. With the technology that we are developing, we can go capture summary data for end-use customers. We can take that data, run it through our analytics engine and move a monthly data point and deliver really significant information to customers that, you know, a couple of years ago were kind of ignored.

That small, medium business customer class is a very, very challenging customer class to touch, because when you look at them through the East Coast, you'll see that they all get lumped into a single bucket, but when you drill into how they act as individuals, it's very, very different.

So now we have the technology in the Cloud that allows us to acknowledge the differences

1 and treat them equally and influence them in ways
2 that are very beneficial to the grid, the end-use
3 customers and to the overall industry, back to kind
4 of how people do business, back to this world of
5 mobile devices.

6 How we communicate is ultimately what
7 dictates how successful we will be, so we really try
8 to build our Cloud-based software in a way that
9 meets customers where they are.

10 Customers want to be communicated to
11 on their device in their hand while they're on the
12 train. They want it on the desktop, but there's
13 still a lot of people who don't use those devices,
14 and the number is decreasing probably by the hour,
15 but there are, so we need to meet them where they
16 are.

17 Next slide.

18 And, finally, this is just a very high
19 level summary of some of the benefits that we
20 deliver, again ranging from increasing customer
21 satisfaction, customer engagement around how do we
22 achieve energy efficiency mandates, and then

1 ultimately operational efficiencies both within the
2 organization of the quality of the utility and also
3 within helping deliver more reliable infrastructure
4 as we introduce more renewables that we are
5 constantly seeing.

6 Next slide.

7 My final comments. I love this space.
8 I love being a part of it during this
9 transformation, and I think what we do is really
10 exciting and I think we are great at it, but there's
11 a lot of people out there doing great things, and
12 it's a new unique system.

13 So we believe that we need to be very
14 flexible as a Cloud-based provider to help to allow
15 us to deliver value within that ecosystem. This
16 includes how you interconnect solar, how you
17 interconnect storage, how you interconnect end-use
18 customers in all classes, and how you serve them
19 appropriately.

20 So a lot more to come on this side,
21 but we hope that in the future we will be down to
22 one platform, obviously, this is the main system.

1 Thank you very much.

2 (Applause.)

3 MR. HINES-SHAH: Thank you, Todd.

4 Next up we have Matt O'Keefe. Matt is
5 Director of Regulatory Affairs and Market
6 Development for Western North America at OPower, a
7 software company based in Arlington, Virginia.

8 Matt, lead the way.

9 MR. O'KEEFE: Good morning. Thanks for having me
10 here today. This kind of conversation is not
11 happening in rooms like this all over the country
12 necessarily, so thank you so much for your
13 leadership on this issue and talking about this.

14 OPower is known for building bridges
15 in Nevada and building bridges here, and I am proud
16 to say -- with two guys without ties to my left and
17 two guys with beards to my right, I apologize for
18 the lack of -- you can't take us out of Silicon
19 Valley.

20 (Laughter.)

21 Today I am going to focus in on some
22 of the micro activities and some of the micro

1 examples of what software service and the Cloud can
2 provide impacts on customers.

3 As many of you know OPower and you
4 know our focus and our work on customer engagement
5 and that we are a provider of demand-side
6 management, customer engagement software solutions
7 to the utility industry, but I want to talk about
8 how that actually hits the ground here today.

9 This is an incredibly small text on
10 this slide here. It makes it kind of hard for you
11 to see, but just to note the scale of a company like
12 ours -- because it was born in the Cloud, which is a
13 great way to begin -- we work in about a hundred
14 utilities throughout the world, and our software is
15 employed to 15 million households via web platform.

16 So, although we are most known for our
17 core work in utilizing efficiencies for which we are
18 quite proud and which resulted in getting customers
19 to reduce energy consumption at more than eight
20 terawatt hours, at this point which is the
21 equivalency to digging in New Mexico off the grid
22 for a year or a house in Chicagoland for 18 hours.

1 We are incredibly proud of that, but
2 there is a lot more to go, and as we look up to the
3 future in which we are expecting more and more new
4 customers, we have to think about how customers
5 engage with their information and what customers
6 expect as far as the levels of technologies are
7 concerned.

8 One of our core is that we have taken
9 a look at this broader shift towards a focus on
10 customers, and we thought increasingly about the
11 expectation of these customers and what they want.
12 Because of that, we have built a variety of
13 solutions that cross the utility spectrum, not
14 primarily focused on the residential consumer.

15 So if you look at the evolution of our
16 product here, we have taken our expertise and
17 engaging with customers more broadly and now work
18 with our clients and utilities to take a complex
19 issue across a variety of contacts from asking folks
20 to engage in response events to communicating about
21 rate changes and engaging people in whatever energy
22 functions overall, and most recently we focused on

1 building stronger digital relationships with the
2 customers.

3 But how is that done? Well, it's on
4 the back of our platform, and I'll just give a
5 little bit about what this means so you have a sense
6 of what we are actually talking about inside of this
7 text here.

8 So this is a three-tier architecture
9 and, as a reminder of a Cloud provider, this is not
10 a traditional enterprise software. There is no
11 installation, no configuration, and our goal is to
12 make IT's problem OPower's problem, and so it's a
13 turnkey solution and it's available from the get-go.

14 So a third of the bottom there, the
15 analytics there, all this is on top of a whole bunch
16 of data, and this is where we are going to go ahead
17 and integrate the data from the utility, third-party
18 data, parcel data, how we assess this data, why they
19 provide that data, et cetera, et cetera.

20 We really start to match all this
21 together. We marry and match this data. We are
22 starting to create it more mature than we did

1 before. So this transformation of data, the
2 processing of data, and trimming of data is actually
3 what we call in the department typical folks who
4 spend 6 to 8 percent of the time on data analysis,
5 so we take all that on our end and we take care of
6 that.

7 So we are running calculations in this
8 layer to make sure that we want to do things like
9 personalized bill forecasts and beyond. We are
10 processing about 35 billion events each month.

11 You go up a layer, you have the
12 same. This segmentation target layer is where we
13 take all the data and we start to divide folks into
14 groups. We learn how things are common with each
15 other, so we segment these based upon energy
16 consumption, perhaps demographics or cytographic
17 attributes, and we are able to also import segments
18 that exist within the utility or, otherwise, are
19 able to import through our system, and here we match
20 with the right content with you.

21 If you are a certain group, a
22 low-income renter, this is where you get matched up

1 with the best content for you. If you are an
2 affluent green, you might get a content match here
3 from this section of content, so this segment --
4 there's that top layer -- targeting happens, and
5 that top layer is communicating energy, so going
6 from the data to match a segment to content and then
7 deliver outside. Input is putting paper, digital,
8 and even phone calls from time to time.

9 So let's talk about what some of the
10 solutions look like at the Cloud and how the Cloud
11 can properly serve the purposes of that. Our core
12 products are residential energy efficiency and to
13 keep energy efficiency have several outputs, one is
14 home energy on-line.

15 You look down there, for example, at
16 the graph down at the bottom at the management
17 report that is your energy information compared
18 against those of your neighbors and then a lot of
19 complex algorithms and calculations and adapting
20 just to make sure this is data that is normalized
21 with you, that is relative to you and that is
22 properly comparing you to the right ten homes, a

1 hundred homes in your neighborhood.

2 Another thing to know is that in the
3 middle of this you see your home is 2400 square feet
4 and not 2100. That immediately changes you in
5 comparison to that line interaction with that data
6 that is available on the Cloud. These things take
7 off more than 50 percent of residential electric
8 savings in Massachusetts and their energy
9 efficiencies.

10 Here's the way to see how this data
11 holds together. So we were working with one of our
12 clients and we wanted to send out the right message
13 to the right person, you might try to find the right
14 segment.

15 So at the top level here the
16 department has already designed the data for OPower.
17 That's if you are in the program or not. We put
18 down another layer and we work it as a utility
19 typically provides information which is do we have
20 an E-mail for you or not, then later down we are
21 going to compare you with some third-party data
22 which is external, which might tell us a little bit,

1 about your ownership rate of the home. That covers
2 that. Then the next layer, which is inside
3 generating our analytic engine, which is about
4 whether or not, based on our design and
5 investigation capability, whether or not you have an
6 efficient HVAC system, an efficient HVAC system or
7 not at all. So you might not have that data on your
8 third-party report, so we can do that inside of our
9 system here.

10 So all of the facts you have for us
11 are matched together to make sure that we are
12 sending that HVAC to the person who needs it the
13 most, nothing saying that the person already had an
14 efficient HVAC after that who needs it the most.

15 Given the time, I will move forward.
16 Another thing that is important to the way we solve
17 this altogether is this machine already running more
18 and more or about the way people actually use energy
19 during the day. We work with our clients the same
20 as our customers not based upon demographics and
21 cytographic information but upon their actual energy
22 consumption.

1 For instance, we start out with eight
2 profiles of all of our customers, eight architects
3 most people fall within when it comes to energy
4 consumption during the day. It was just the tech
5 side of these on the market, as you can tell, but
6 this year is a way of using the data that's out
7 there without actually using patterns or segments
8 properly, then as more data came on-line, we want to
9 share out all our clients using this information.
10 It really wasn't eight. Truly it is five that we
11 were using more data and more data piling on to the
12 system and it's changing on a weekly and monthly
13 basis how we want to divide up folks.

14 So I won't go through all the
15 examples. I'll just highlight one more example,
16 which would be the bill advisor where the customer
17 can go on-line about their information, but on the
18 back end the customer certified representatives also
19 have the same information in front of them at a
20 deeper level.

21 What's turning out on one end result
22 is so important to the customer is that they expect

1 an incredible amount of insight from their utility,
2 incredible insight from their banks, and from the
3 airlines, and from other legs of industry that no
4 information -- sensitive information is even asked
5 for, like the gate change over at United. I'm
6 surprised United is not charging for that and what
7 folks expect from utilities.

8 (Laughter.)

9 We are seeing customers that receive
10 this information have a better impression of their
11 utilities and further trust them with additional
12 information.

13 It is important that we ask customers
14 to be more and more engaged in their consumption
15 over time. So just to say 400 years of data results
16 now OPower alone, one company doing this, and the
17 collective expertise of this panel is very
18 impressive, and it's not a new area, and although we
19 might be a little bit behind this industry, we are
20 catching up quickly.

21 And, you know, I look forward to
22 hearing the rest of the folks on the panel who

1 traveled here today, and thank you very much for
2 presentation about this issue.

3 MR. HINES-SHAH: Thank you, Matt.

4 Next up we have Brian Bowen. Brian
5 manages Regulatory Affairs and Market Development
6 for FirstFuel in the Midwest and the United States
7 and Canada.

8 Please join me in welcoming Brian.

9 (Applause.)

10 MR. BOWEN: Thanks so much. I'm the second with
11 a beard, but I did bring a tie, but thank you,
12 Mr. Chairman, Commissioners and Staff for having us
13 all here today. This is obviously a very important
14 and vital issue and kudos to you all for bringing
15 this panel together and addressing it head on.

16 (Slide presentation
17 delayed.)

18 As I was just introduced, I want to
19 let everybody know I am based here in Chicago
20 working on Michigan Avenue just a few blocks away,
21 and the company FirstFuel is actually based in
22 Boston. We work across the nation in Canada and

1 also in Europe now.

2 So my presentation, when it arrives --
3 here we go. Fantastic. My presentation today is
4 going to focus a bit on our work in engaging
5 commercial customers within commercial markets
6 through energy data analytics, and the goal here is
7 -- and, again this panel was meant to talk about
8 customer benefits here, so I'll really focus on
9 that, although, of course, there are four-star
10 benefits on the utility side as well.

11 So, first, of all, who is FirstFuel.
12 We are a customer intelligence platform for
13 utilities. We have about 25 utility customers in
14 the U.S. and Canada and we process a million meters
15 worth of data.

16 What we do is we take energy meter
17 data, interval data, AMI, and process that
18 information into customer intelligence. We never
19 have to send an engineer out to the building to
20 understand things like how energy is used. It's not
21 mentioned, and we do that to engage customers, offer
22 them the right service and also meet utilities'

1 energy efficiency goals at large scale.

2 And I want to mention the way that
3 this has traditionally been done is fairly
4 time-consuming, as I mentioned, getting on the phone
5 with the customer, really finding out what their
6 needs are, but these are -- this is a platform we
7 built that's born in the Cloud as well and is really
8 enabled by technology that five years ago really was
9 not available.

10 It's really speeding up the process of
11 serving customers, because one thing we know for
12 sure is that customer expectations are changing, and
13 it's not just the residential consumer who is used
14 to having control of their thermostat through their
15 Smart Phone, it's also business customers.

16 I want to pull out this quote here
17 from the most recent J. D. Power survey on
18 commercial customer energy use, and one of the
19 biggest potential gaps in customer service that they
20 identify is the business customer's on-line
21 experience.

22 There's a true need from the business

1 customer. This is a trend across the industry to
2 have a better digital experience, and it plays out
3 in data. It's a bit hard to read, but essentially
4 what J. D. Power found, when they interviewed the
5 first of 23,000 CNI customers, is that the on-line
6 experience for CNI is essentially staying the same
7 and in some cases getting worse. There's been some
8 improvement in terms of the clarity of information
9 navigation in terms of getting around utility
10 websites, but overall they find that the web
11 experience is declining in its usability and it's
12 certainly not doing as well as the most secured in
13 that survey.

14 This is a trend that doesn't just
15 affect the small customer who acts a little bit more
16 like a residential customer who pays attention to
17 their bill. It affects large users as well, but I
18 did want to hone in on the small customers, because
19 in this survey you see near unanimous agreement from
20 small and medium business customers that they want
21 more personalization. There isn't a
22 one-size-fits-all approach to reaching this market.

1 There really is an expectation that
2 there should be personalized offerings for SMB
3 customers, and, as you can see on that lower bar,
4 it's a bit hard to read, but it's pretty well real
5 satisfaction with the latest work. These are trends
6 across the industry. There's been certainly a lot
7 of work done here in Illinois to improve on what you
8 see here in the overall results but it's a trend
9 that you see.

10 So how does FirstFuel address this?

11 Well, the first thing we do is we're providing
12 better intelligence to utilities so that they can
13 understand their customers from the get-go. We do
14 that with a fairly limited number of inputs. We
15 start with the building address making them aware in
16 the world the commercial facility is located, and we
17 take the year's worth or more, if we can get it, of
18 interval meter data at the gas and electric, and
19 what we add to that is local weather data, a very
20 fine grain weather data, as well as GIS inputs,
21 satellite imagery.

22 We do what you could think of as a

1 super-charged Google search about that facility. Is
2 it a laundromat or is it a dry cleaner, and we find
3 out if there's such a thing through natural language
4 processing, and we take that data and we convert it
5 into customer intelligence so we can disaggregate
6 whether we can find out how much energy is being
7 used for lighting, how much for HVAC.

8 We can also set a base line so that
9 performance can be tracked over time, and this is a
10 solution that's really been highly validated for
11 validations on our disaggregation algorithms. It's
12 probably between 2 and 7 percent of the
13 disaggregation you see in your sub-metering or a
14 traditional walk-through audit. It's really been
15 highly validated, and what you get out of this is
16 benefits on the customer engagement side and in
17 delivering efficiency programs, and that's how we do
18 that.

19 So on the demand side management
20 delivery side, we start very broad. You can see
21 with this rather small amount here we start by
22 looking across the commercial customer base for

1 energy saving opportunities.

2 So the red dots on this map here
3 indicate buildings that have a great amount of
4 energy savings potential, whereas the green dots are
5 doing fairly well, and the goal here is to target
6 the buildings that actually have the potential
7 rather than to do marketing or outreach that can be
8 possibly non-effective.

9 The second step is to go deep, and we
10 made our name as a company that does remote audits
11 of buildings, so rather than doing a walk-through
12 engineering audit, we can get the same results
13 remotely just by processing the data. We then
14 choose to subset the buildings where they are going
15 to get the most bang for the buck for doing that.
16 Part of the benefit here is that it also informs
17 utility staff.

18 So these are tools that account
19 managers can use to better serve their customers.
20 They can generate printing the E-mail pieces out of
21 the intelligence that we are generating and they can
22 also give customers access to web portals so they

1 can share share information.

2 And the final step here in this
3 process is to monitor and continuously engage the
4 customer if we see that it performs a certain thing
5 where there isn't the expected results and we are
6 able to do this, again, at scale through
7 Cloud-based meter data and analytics.

8 Getting back to the point about
9 customers wanting a better digital experience, we've
10 also built a platform we call First Engaged, which
11 offers exactly that, and it's a self-serve platform
12 for customers that log into their same billing
13 information they use throughout the utility platform
14 for E-billing, for example, and what we offer are
15 billing specific insights about how to use energy
16 more effectively.

17 This isn't billing like you save this
18 much by doing X, Y, Z. It's actually tailored to
19 that specific site, and through that we are also
20 offering very clear calls to action, a very solid
21 business case for say participating in a lighting
22 program or an HVAC program. The utility is designed

1 to serve the customer segment.

2 In addition, there are opportunities
3 for customers to update their information. If their
4 phone number or E-mail changes, that sort of
5 information can be tied into the utility's CRN, so
6 they have a better sense of how to contact that
7 customer, and, you know, we are really doing this on
8 a very large scale, and I want to emphasize that as
9 well.

10 With our customer EON in the UK, this
11 is being rolled out to upwards of 40,000 small and
12 medium, commercial customers. So really on a broad
13 scale, we are able to offer a great deal of
14 personalization which, as we know, it's what more
15 customers want and expect.

16 In terms of the other impacts, we have
17 an energy efficiency delivery, and I want to call
18 attention here to our ability to market to more
19 customers by doing that broad analysis where
20 customers are going to have the most potential. We
21 are able to cut costs by one and three times and
22 that means a lower cost per energy efficiency

1 delivery.

2 We have also really revolutionized the
3 auditing world. We are two-thirds less in terms of
4 cost of doing an engineer walk-through audit.

5 That's just the cost side. As any of you know who
6 have done the engineering walk-through audits, it's
7 obviously very disruptive in the general course of
8 business. It's hard to convince customers to do
9 that. We can do it remotely and perhaps present the
10 results over a webinar anywhere in the world.

11 It's much easier to get the seascape
12 involved in that and interested in efficiency, and
13 then, finally, we are able to identify more savings
14 and present a better business case to the customers
15 which means that we are able to do multiple projects
16 per site.

17 And when we are doing energy
18 efficiency rather than just focusing on-line or just
19 focusing on HVAC, we can really go deeper for the
20 customer and that builds that trusting relationship
21 between the utility and the customer.

22 And so, finally, just to sort of talk

1 about our approach and what we think the future of
2 customer intelligence is, in the past we have done
3 an energy efficiency, and the customer engagement,
4 and the customer service, and it was kind of a
5 first-come, first-serve way.

6 If you are the first one to pick up
7 the phone, you are going to get the benefit, but by
8 doing this broad and deep engagement and really
9 looking across the customer's portfolio, we are able
10 to offer services to customers that are overlooked,
11 that S & P segment, customers that aren't the top
12 person on that account manager's list, and that
13 means better ratepayer parity and available data and
14 access strategy and efficiency.

15 Again, as I mentioned, we are able to
16 remotely manage the billing and really assess the
17 company and really rely upon the Cloud to do our
18 back-end processing. We are able to do this at high
19 scale and low cost. Here is just a few more
20 customers who believe that this combination of data
21 size are real expertise in building size,
22 understanding how energy is used within the

1 building.

2 And our founder's base is an
3 enterprise zap. It's really something that's been
4 attractive to utilities all across the country and
5 the world.

6 And I really thank you for your time
7 and thanks again to the Commission and I look
8 forward to the panel.

9 MR. HINES-SHAH: Thank you, Brien.

10 Our next presenter is Jake Oster.
11 Jake, is Senior Director in Regulatory Affairs for
12 EnergySavvy. Jake works closely with policymakers
13 for the federal government to create awareness about
14 technological innovations for the ESN industry.

15 Please help me in welcoming Jake.

16 (Applause.)

17 MR. OSTER: Starting the time clock.

18 Mr. Chairman, Commissioners, thank you for holding
19 the panel. I appreciate it. Good morning. As
20 everybody said, this is an important topic that
21 doesn't get a lot of attention. We appreciate your
22 taking attention on this, and we look forward to

1 working with the Commission to think about some of
2 the changes.

3 I want to talk about what EnergySavvy
4 does, and we have spoken a lot about -- overall
5 about how computing benefits are being drilled down
6 to a level or depth of one sector of utility energy
7 efficiency programs and how they operate and how we
8 can improve their software and what EnergySavvy
9 does. So I will show you a little bit about
10 EnergySavvy in more detail and a little bit about
11 who we are and what we do.

12 We are a 6-plus-0 company based in
13 Seattle with offices in Boston and we are a hundred
14 percent focused on Cloud-based software for energy
15 efficiency programs. We have more than 75 employees
16 working together in utilities in more than two dozen
17 states. We are in the business of more than 30
18 utilities at this point. We serve large and small
19 avenues. We serve large munis and public, and we
20 also serve some public organizations that provide
21 efficiency programs to customers.

22 It's also important to note that the

1 folks that founded EnergySavvy are former dot.coms,
2 so we are made up of folks that come from Microsoft,
3 that come from Amazon, that live in Seattle, and we
4 realize that energy efficiency programs for the
5 purpose of building software to drive results for
6 the customers and the utilities, and to insure that
7 data collection are being done properly to meet the
8 needs of our customers, and that's what we set out
9 to do. So that's a little bit about our software
10 program overall.

11 We think of efficiency programs as
12 sort of a cyclical chain in which there are
13 different steps along the way and different things
14 that need software to make it work. The first thing
15 is engagement. You have to engage customers to
16 bring in new orders. The unique thing about energy
17 efficiency is that it doesn't find you. You have to
18 come to them, bring you to engage efficiency.

19 So we built an on-line tool that is
20 exciting and fun for customers and that easily works
21 for utilities to bring customers in order to get
22 them to the state program. Once you get the

1 computer to work, it's great. That's the easy part,
2 right. You have to then carry them through a chain
3 of steps to get them into an energy efficiency
4 project.

5 We build a second tool we call OPTIX
6 Manage manages workflow automation. It is data
7 tracking. It is building a Cloud-based platform
8 that the utility, the customer, and the contractor
9 are all engaged at the same time, and with the
10 customer it is about finding out how you get a
11 contractor, what is your rebate check.

12 The important thing is customer care.
13 If you are a contractor, you are worried about
14 where your different projects are, manage your
15 project flow, making sure you cut the costs of
16 running a small contracting business to do
17 residential efficiency projects across a wide
18 variety of service territories.

19 So now we have got the customer at the
20 door and you've taken the program. At the end of
21 the day, we have to measure the impact of that
22 efficiency, and I could dedicate hours talking about

1 nothing but the energy efficiency measuring. There
2 are piles and piles of paper grids out there
3 measuring something that doesn't exist.

4 So we built software to speed up and
5 enhance that energy efficiency in ways to improve
6 the experience for utilities, drive value for
7 ratepayers and better reporting parameters. Like I
8 said, I could talk about it for hours.

9 So let's step back. If you are like
10 me, and, Tom, you may be the only person in the room
11 that actually has a computer science degree. I'm
12 guessing everyone else here is not, So there's a few
13 of us in here.

14 So if you are like me, to talk about
15 software you need to see what it does. You need to
16 actually touch and feel it, and understand what it's
17 like for a utility, for a customer to actually
18 understand what software looks like. So I am going
19 to show you some screen shots of what our software
20 actually looks like, so you will understand what
21 I am talking about.

22 So our first product is OPTIX Engage

1 is about customer data. It's an on-line auto tool
2 that takes you through steps that ask you about your
3 home and gives you an end theory of what your
4 savings are.

5 We started out with these simple
6 questions at home and then we take this and convert
7 it into 40 simple questions that are entirely
8 interfaced, so I would challenge you that you would
9 not have to get up from your desk to answer the
10 questions on your own. This will take you no more
11 than five to six minutes to answer. It's incredibly
12 simple and engaging.

13 Most people tell us it's kind of like
14 a video game. It's very simple. Again, this is
15 what we show you, your energy profile, what your
16 potential savings are, and the important things to
17 think about is this is a gateway to utility energy
18 use programs.

19 When you hit the start button, it
20 gives you a menu option for the history of the
21 customer that exist in the program, but the other
22 value here is the utilities. They need data and you

1 need data about customers, so you want analytic
2 engine collecting data about the different things
3 that are going on in the home of the customers you
4 engage with the software, and so we are collecting
5 data. We can tell you where the window AC units
6 exist, whether the customer still have light bulbs.
7 All of that data is being collected on a five-base
8 software platform. And when we do this, we start --
9 we do it for residential customers and we also do it
10 for small, medium and business customers. We have
11 gone after what we thought as energy efficiency.

12 We have taken the residential tools
13 that we have and converted that to small, medium
14 businesses and then we also recognize that a lot of
15 customers don't engage on that, and so we built a
16 paper-based version of that as well. It's an
17 incredibly successful program we've got. We move
18 for we have a lot of success with this. I don't
19 want to go through out of the steps, but I want to
20 point to one that the box is not properly going over
21 on my slide.

22 (Laughter.)

1 Lined up you see that more than nine
2 out of ten people start on-line engagements. That's
3 an incredible average of single digits. Ours is
4 around 93 percent right now; others 93 based on
5 performance, but that's the amount of people we
6 start with. That's getting people in the door. So
7 that's our first goal. That's OPTIX Engage.

8 The second tool we call OPTIX Manage,
9 and what OPTIX Manage is that it's about analytics,
10 about data management. It's about program
11 automation. It's about making the job easier,
12 making the program easier, the contract easier, and
13 giving the customer the experience of dealing with
14 the utility in a way that's more akin to Kayak or
15 Priceline.

16 So this is what it looks like. I
17 won't go through this in depth for time, but the
18 other part of this is about analytic reporting.

19 You know, Commissioner, you probably
20 ask utilities for data about different things that
21 you are trying. Staff will probably call on the
22 utility after reporting energy efficiency programs.

1 The important thing that you have to
2 realize is that the utility needs to have your data
3 at their fingertips to be able to pull it up when
4 necessary, and there's other things they manage to
5 do without giving utility data at their fingertips
6 they can control and demand.

7 So, again, I don't want to through all
8 the steps and boxes, but I want to point to one
9 quick stat that we have as a result of employing
10 management utilities and using natural gas
11 efficiently. We have reduced some of their time by
12 40 hours a week that was spent doing error
13 corrections.

14 If you look down, you can also see
15 Sound Energy and EnergySavvy from the State of
16 Washington receiving a thousand hours a year on
17 application processing. This is the type of benefit
18 that Chrome software offer utilities about driving
19 inefficiencies, reducing operational hours, and
20 improving the experience of the utilities, but then
21 also driving efficiencies that help benefit the
22 ratepayer when it comes to the expense of energy

1 efficiency. That's Product one of two Manage and
2 Engage.

3 I would like to show you a little bit
4 about Product One of three, what we OPTIX On-line.
5 It's our newest product and it's doing measurements
6 in a continuous fashion of a savings venue and we're
7 doing it for every single product in the energy
8 efficiency program.

9 If you spend time thinking about the
10 evaluation measurement and verification of energy
11 efficiencies, this is a big deal. It's a big change
12 in the industry, and so what you are looking at here
13 is an image of what the industry calls billing
14 housing when we look at usage on an individual
15 premise before and after the installation of energy
16 efficiency measures, and the way we measure today is
17 we have assigned values for different energy
18 efficiency measures.

19 We say that light bulb for a few
20 hundred kilowatt-hours, so you want to figure out
21 how much energy you saved. Well, we installed 10
22 light bulbs there or we saved 2000 kilowatt-hours,

1 but we don't generally go back to the meter and say
2 what happened in the home or business as a result of
3 installing these light bulbs, and that's what we
4 want to do. We want to look at savings in the
5 meter.

6 The other problem we have in energy
7 efficiency measures today is energy efficient
8 measures are done, with all due respects, with
9 nothing but components. Again, it's not nothing but
10 generally components, and we do energy efficiency
11 Smart bulbs for premise report after the fact that
12 gets filed with the Commission to show the result of
13 that inefficiency. That's really useful and
14 important, but if you run an energy efficiency
15 program with a utility compliance reports today
16 doesn't tell you how you are doing throughout the
17 entire 12 months you are running this efficiency
18 program, and all of that is lost opportunity to the
19 utility that is then lost to ratepayers.

20 So what we want to do is we want to
21 look at the meter. We want to look at it
22 continuously and we want to be providing continuous

1 meter measurements on an ongoing basis, so we are
2 doing continuous measurements of the meter. We're
3 not using estimates, and, importantly, we are not
4 sampling. We are looking at measurements of every
5 single process in the program.

6 So what does this look like? Again,
7 if you are like me looking upward at software, this
8 screen shot of our demo markup of our color-coded
9 block, this is what it would be like if you were
10 sitting in a utility running an efficiency energy
11 program.

12 You would not only know the processing
13 budget, but you would also know your meter savings
14 on an ongoing fashion, and you would know how that
15 compares against your program goal. You would know
16 how you are doing, useful information, but it's only
17 marginally useful to find out if you are 84 percent
18 where you want to be.

19 Now you need to know what do I do with
20 that information; how would I actually drive
21 improvements, so now with the granular data, we can
22 slice and dice all of the information collected as

1 part of the energy efficiency program and show you
2 what is the increase in savings and what's also
3 decrease in savings.

4 So you might see that LED lighting is
5 doing a good job. This is really small print. LED
6 light is doing a good job. We don't contract for
7 lights.

8 On the blue side or on the red side of
9 the chart is subject to increase in savings. You
10 find insulation is not doing a good job. You find
11 contractors really under-performing, and then you
12 can go and slice and dice that even further and find
13 out why that contractor isn't performing.

14 This offers an opportunity to go out
15 there and enforce corrections and insure that the
16 customers are getting the best for that job for
17 their businesses, to sure the ratepayers are getting
18 the most value in their program and for the
19 utilities driving most efficiency savings programs.

20 So what are the values that come out
21 of this. I don't want to go through this entire
22 stack of what I call pancake propositions. Let me

1 just highlight two.

2 So first let's talk about the customer
3 that we were talking about as a panel. If those in
4 the audience have done energy efficiency projects in
5 utilities, they found that you talk to the utility.
6 They do their cross check and got the rebate check
7 and they were done.

8 At no point at the end of the day did
9 anyone tell you how much energy you saved, and so
10 energy efficiency is this invisible thing that we
11 can't touch or feel, that we don't all trust in,
12 because we can't touch or feel it.

13 So what about having a project level
14 data to report out to customers, hey,
15 congratulations. You save 15 percent or more on
16 energy efficiency products. Think about what that
17 would do for customer satisfaction or trust and
18 energy efficiency and you can just engage the
19 customer towards data programs.

20 Another thing we talked about here is
21 we talked a little bit about the smart grid
22 utilities of the future, so one of the challenges

1 then in the efficiency is the way we measure sort of
2 the trust in the value of the energy efficiency, not
3 just for customers, but also for utilities.

4 How do we saving is individual? How
5 do we power up the grid? How do we take a year old
6 measurement report and then apply that to the grid
7 and whether we value it and we count on it if
8 there's solar equipment?

9 You have got to have energy efficiency
10 measurements that are continuous in real-time and
11 value meter so we can understand how it impacts and
12 allows us to build energy efficiencies as an
13 equitable energy resource on par with the -- on par
14 with DR that can give us value measurements to show
15 us the grid reliability energy efficiency it
16 provides. That's what a real measurement does for
17 us. That's the overall energy savings platform.

18 Again, I want to thank you for the
19 opportunity to be here. I look forward to being on
20 another panel this afternoon and we will talk a
21 little bit more.

22 (Applause.)

1 MR. HINES-SHAH: Thank you, Jake.

2 The final presenter of this panel is
3 Bryon Koskela. He's Senior Director of IT
4 Infrastructure at PJM Interconnection.

5 Please join me in welcoming Bryon.

6 (Applause.)

7 MR. KOSKELA: Thank you to everyone here. I also
8 want to thank the Commission for allowing me the
9 opportunity to speak on this topic, and I want to
10 talk a little bit about PJM's Cloud use and how we
11 choose from a financial perspective and then cover
12 some other thoughts around cyber security and some
13 other types of software models that are out there
14 that also run into the capital expense issue.

15 So just to refresh, PJM is a Regional
16 Transmission Organization (RTO) that insures the
17 reliability of bulk electric system serving
18 61 million people in all of and parts of 13 states,
19 plus Washington D. C. We have 940 members that make
20 up PJM, many of whom are either represented in --
21 some are represented here today and on various
22 panels. We are just over a quarter of the load

1 generation in eastern interconnection, so we serve a
2 pretty large footprint. To do this, we focus on
3 three things: reliable operations through
4 competitive wholesale markets and regulatory
5 planning.

6 PJM provides a large amount of
7 real-time and historical data through our website,
8 as well as through some of our web applications,
9 such as database, real-time data and historic data
10 to support market transparency, as well as giving
11 information about regional planning information
12 through our website.

13 Because of our focus on bulk electric
14 systems and our wholesale market, PJM does not
15 participate in retail markets and, as such, we don't
16 really deal with the end-use customer and the
17 average household customer. We deal with our
18 membership, so a lot of -- some of our presentation
19 today, you know, don't necessarily apply to
20 PJM's focus.

21 PJM is a highly technical
22 organization. We have a number of technologies that

1 allow us to support operations and market functions
2 and we have investigated Cloud-based solutions, and
3 I would like to start again by kind of re-defining
4 what we mean by Cloud.

5 We typically at PJM use software as a
6 service. Again, software that we use through the
7 Internet is not installed upon any computer system
8 in our data center or at our power box. There's
9 also platform service, which is more for web
10 application development and infrastructure as a
11 service which replaces the traditional data center
12 behind the firewall with the data center.

13 While we looked at these services, we
14 have mainly just focused on software as a service
15 just because it met our needs. We see a lot of
16 benefits that are out there from a cost perspective
17 for us to, you know, not have computing
18 infrastructure in-house from the software as a
19 service.

20 It also allows us to potentially
21 offset development needs, because really when you
22 are buying software as a service, you are buying a

1 free package application, so you don't have to
2 customize it as much. You are getting just the
3 package that is delivered.

4 Right now from an infrastructure and a
5 platform service, we've been very slow about
6 adoption of those technologies. We have looked at
7 them. We have investigated them. We see potential
8 use cases for those in the future, but because of
9 our function, we also are under very critical
10 infrastructure protection standards. We have to
11 comply with them from a regulatory perspective. All
12 utilities need to do that. For us, that's the
13 primary focus.

14 The substandard require us to identify
15 the computing assets that we have in support of a
16 bulk electric system and then make sure that they're
17 protected through various standards. Because of
18 this mixing in kind of infrastructure to serve as a
19 platform as we service, our core function would
20 potentially increase compliance risk.

21 Again, we could work with a vendor
22 trying to understand that, but at this point we feel

1 that infrastructure as a servicing platform we are
2 not quite ready to bring those into our core
3 functioning, so we have been very cautious in
4 approaching that.

5 However, what is happening is the cost
6 benefits from the limited uses of software as a
7 service, so we have formed what we like to call a
8 power government scheme, and so a lot of moving into
9 the Cloud is really about managing risk, risk to
10 your organization.

11 What happens if that data is not
12 available or what happens if that data gets
13 breached? What about data confidentiality? That's
14 critical for PJM to have, and our members entrust us
15 with their data and very confidential sensitive
16 information, so we want to make sure that we move
17 very cautiously and carefully to protect that data.

18 So when we set up this power
19 government scheme, we looked at members from our IT
20 organization, our enterprise security, our
21 procurement, our legal and our risk management
22 folks. They get together and look at various

1 technologies that are being proposed and brought
2 into PJM, and we review that for traditional IT
3 services, such as availability and reliability, and
4 then we really focus on cyber security and
5 confidentiality of the data that we could
6 potentially be putting on the Cloud.

7 The team focuses on that risk and
8 looking at the risk and making sure that that risk
9 is being treated so that we are comfortable in
10 moving data there.

11 So, like I said, we have looked at
12 this for software as a service. We mainly use it
13 for our internal IT, HR function, so the success
14 factor is an offering from SAP. We use that for our
15 employees and for our training, and there's
16 definitely I believe cost savings from having to
17 have those types of applications in our data center
18 versus having it out in the Cloud and from a cost
19 perspective.

20 I think one of the other things we
21 focus on is ensuring the proper contracting. As
22 Dennis has mentioned, with the Cloud services

1 there's a lot of factors that need to go into
2 insuring that you are understanding their service
3 level of agreement factoring in leading into Cloud
4 services, that you have a strong contract, that is
5 if there's problems with the service level
6 agreements, that it is contractually enforceable.
7 So this focus on that risk on the contracting
8 negotiations is something that we look at very
9 closely.

10 With that, the government scheme
11 needed to look at those technologies. The
12 recommendation that I would need, and we do, is that
13 we need to understand the requirements of what data
14 you are going to move to the Cloud; what systems
15 that you are going to move to the Cloud;
16 understanding the impact to your business if that
17 data is even not available or potentially
18 compromised; understanding the service level
19 agreements that you are negotiating and making sure
20 that the Cloud provider is that trusted partner; and
21 you have an exit plan if for some reason they're not
22 living up to the service level agreement.

1 And you can also focus on the controls
2 that you put in place to protect your data and then
3 also that you put in place to ensure that if you are
4 doing some type of Infrastructure-as-a-Service or a
5 Platform-as-a-Service, there's appropriate security
6 controls that, you know, protect you in case there
7 is a breach at the Cloud provider that doesn't come
8 back into your network, so that's our kind of focus
9 on security.

10 The last thing that I was going to
11 talk about is again financial concerns. We do
12 typically treat this as an expense. We review it by
13 our finance group I think based on the requirements
14 out there that is an expense.

15 There is another software model that I
16 would like to bring up for this, which is Open
17 Source software which has gained a lot of traction
18 in the last few years.

19 Traditional software models you pay
20 that license. You pay capital costs to license up
21 front and then support costs ongoing. You have
22 updates of that software. You have many traditional

1 vendors continue to operate as well.

2 In the new model you are paying for
3 support. So the software is Open Source. It's out
4 there for free. You can download it. You have a
5 lot of options.

6 One option you may have heard of is
7 Red Hat Linux Software Operating System, as well as
8 Red Hat JBoss Application Platform. Those things
9 are open. You can download them. You can use them
10 and then you purchase the support for those tools.
11 That is also typically treated as an expense and yet
12 can be something to consider maybe in the later
13 panels as well to look at that model.

14 More and more companies are offering
15 that type of model with their software packages, and
16 PJM has moved probably more in that area than in the
17 Cloud services. We do use a number of those
18 packages today and we are running into that issue of
19 expense versus capital with those.

20 With that, I would like to thank you
21 for giving me the opportunity to speak today on the
22 topic and I'm willing to answer any questions that

1 you have.

2 MR. HINES-SHAH: Thank you, Bryon.

3 (Applause.)

4 I think in the interest of keeping on
5 schedule, we are going to have to request that any
6 questions be done either -- I know a few of you are
7 speaking on subsequent panels, but feel free to ask
8 questions during the break of any of the panelists.

9 And I'm sorry. This is really useful.
10 On behalf of the Commission, I want to thank each of
11 the presenters for educating us on sort of the
12 background history of Cloud computing and
13 specifically applications and challenges
14 particularly in the energy arena. So thanks very
15 much to everyone.

16 (Applause.)

17 We will take a few minutes break.

18 (Whereupon, a break was
19 taken.)

20 CHAIRMAN SHEAHAN: I would like to ask everyone
21 to take their seats and the next panel to join us up
22 front. Thank you again to our presenters for your

1 insights on the different types and functions of
2 Cloud-based Arrangements.

3 To commence our discussion Panel 2, we
4 will begin by focusing on existing impediments that
5 prevent utilities and customers from benefitting
6 from these new IT models, whether those impediments
7 can be overcome by utilizing Cloud-based
8 technologies and the benefits of using Cloud-based
9 technologies versus traditional on-premise software
10 applications and platforms.

11 To lead our discussion, I would like
12 to introduce our moderators for Panel 2. My Legal
13 and Policy Advisors, Anastasia Palivos and Elizabeth
14 McClerlean.

15 Please join me in welcoming Anastasia
16 and Elizabeth.

17 (Applause.)

18 MS. PALIVOS: Thank you, Chairman.

19 As the Chairman said, my name is
20 Anastasia, and Elizabeth and I will be your
21 moderators for Panel 2. Panel 2 is designed to
22 answer the following questions: How has a policy

1 market design and rate regulation not kept pace with
2 and may impede the ability of utilities and
3 customers to benefit from new IT models?

4 The format of the panel will consist
5 of questions presented by Elizabeth and myself with
6 the opportunity to hear from each of our panelists.
7 If time permit at the end, we will take questions
8 from the audience. Before we begin the discussion,
9 we will briefly introduce our panelists.

10 MS. McCLERLEAN: Thank you, Anastasia.

11 First, we will be hearing again from
12 Tom Siebel, the Chair and CEO of C3 Energy. Next we
13 will hear from JR. Tolbert, Jr., is Senior Director
14 on State Policy for Advanced Energy Economy.

15 Our next panelist is Joe Surber. Joe
16 is Senior Vice President and Chief Information
17 Officer at AGL Resources. Our next panelist is
18 Carol Bartucci, the Director of the Smart Grid
19 Initiative and ComEd's Information Technology.
20 Ms. Bartucci is responsible for delivering projects
21 to the smart grid.

22 Lastly, we will hear from Janice Dale,

1 who's the Chief at the Public Utility Bureau at the
2 Office of the Illinois Attorney General.

3 To jump start our discussion, the
4 first question of the panel is what are homeowners
5 and businesses looking for from their utilities that
6 Cloud computing can deliver? In other words,
7 what can Cloud computing do that other less costly
8 technologies cannot?

9 And I will leave this question open to
10 the panel.

11 MR. SIEBEL: Do you want me to start? I will
12 take a shot at it. We're on. Testing. Good. No
13 slide is necessary.

14 As we move from the grid to the smart
15 grid in this kind of fully-sensitive value chain, we
16 have the opportunity to optimize this infrastructure
17 in many ways. And what's in this for the consumer:
18 resiliency, security, reliability, lower costs,
19 lower environmental impact, higher levels of
20 customer satisfaction, higher levels of customer
21 engagement.

22 Now, as we sensor this infrastructure,

1 the amount of data increases by six orders of
2 magnitude. Let's think about this. If we read a
3 meter once a month the way that we used to, that's
4 twelve times a year. If we read it every 15 minutes
5 as we will be doing at ComEd very soon, if we are
6 not already, okay, this is going to be 32,000 times
7 a year, so this is a forward event.

8 We have measurements of units across
9 KND lines. They're delivering signals at 50 hertz
10 cycles. This will be 50 times a second, so the data
11 increases by seven orders of magnitude.

12 Now the data in just the rates are
13 staggering the data, so the data sizes are
14 staggering, and basically it is -- I would argue,
15 and I think I'm on firm ground here, okay, that it
16 is technically impossible for us to look at loose
17 data without doing an elastic kind of infrastructure
18 until the benefits are clear, okay, and the mandate
19 is clear. It's just a question of how long it's
20 going to take us to get there in the U. S.

21 MS. BARTUCCI: I am Carol Bartucci again from the
22 utility ComEd in Chicago. My perspective is, you

1 know, I come from the utility side and that is I
2 think the customers want choice and they want tools
3 or applications that are, you know, customer-user
4 friendly, and me, being the technology person at the
5 utility, we are very focused on running the utility.
6 Making sure we want to keep the lights on is
7 absolutely important. We want to have secure
8 systems from what we develop, but our core
9 competency is not putting together the systems that
10 you saw in the earlier presentation.

11 You saw some absolutely fabulous
12 software development that for -- if I was going to
13 build that on my own, it would take a lot of time.
14 We don't develop packages like that any more.
15 That's just not core efficiency, and to give the
16 consumers what they really need to manage their
17 electricity or whatever they might want to do with
18 the power usage, these companies are the way to go.
19 They are the ones that develop products that are
20 fantastic as opposed to me just developing it for a
21 smaller, you know, 4 million meters.

22 If I were to develop something for

1 4 million meters, it would cost a lot, but I could
2 go to a vendor who has huge experience developing
3 hundreds of millions of meters maybe. Their product
4 I think is going to be better than mine.

5 MR. TOLBERT: I would add yesterday I had this
6 experience I think sort of incapsulates the way that
7 consumers want to utilize their utilities, the way
8 consumers want to utilize all things that we
9 encounter within a very clear picture.

10 I was walking down the street here in
11 Chicago during the time that the Pope was speaking
12 on the lawn of the White House. I put my head
13 phones in. I put them into my phone. I lifted my
14 phone out and watched the Pope speak as I was
15 walking down the street.

16 That's to say consumers want access to
17 the goods and services. They want access to these
18 things at the snap of their fingers. They don't
19 want to have to wait for the monthly bill to come
20 each month to tell them how they might be able to
21 reduce their energy consumption or how they can
22 better manage their energy consumption.

1 They want all of those things at the
2 tip of their fingers, and the thing that we have
3 seen, and I would totally agree with you, is that
4 there are a host of technologies out there that make
5 that possible for the consumer, whether that be the
6 software device that we have been talking about
7 today, the software platforms, or whether it be a
8 device like NEXT that's in their house, or the solar
9 panels on their roof that gives them the opportunity
10 to be able to have more control over their energy
11 supply, and all of that is really driven by access
12 to the Cloud and being driven by Cloud computing.

13 MR. SURBER: I would just offer that I think at
14 the core the consumer wants safe, reliable
15 cost-effective energy, and I think we are always
16 trying to find new ways to engage with our customers
17 and you would hope that people just like you
18 interacted at the degree of interest in listening to
19 the Pope on video, that you had the same interest in
20 measuring your power consumption or your gas
21 consumption, and how can you deliver that more
22 effectively.

1 One of the things I think is really
2 important to understand is the layers of the Cloud
3 that you employ as a utility. Some of the solutions
4 you saw I agree are fantastic solutions, but a lot
5 of them are Cloud native applications that are born
6 in the Cloud applications.

7 The things that we are embarking on
8 kind of a new area of customer service at the
9 utility front that there are not millions of
10 applications that the utilities have had at their
11 disposal for years, and I think one of the choices
12 we always have to make is what should be in the
13 Cloud or shouldn't be in the Cloud.

14 I think the point that Tom made
15 several times it's changing fast and the aspirations
16 of the Cloud is phenomenal. The challenge is that
17 if you look at the target chart of the utilities,
18 you have the core which in many cases the customer
19 care system and the operational services system has
20 taken decades to develop. You then have kind of a
21 secondary ring which includes a lot of the
22 productivity apps, especially that Microsoft puts

1 out to E-mail basically people are already
2 comfortable with.

3 Quite frankly, the utilities is not my
4 highest and best use of my e-mail system. On the
5 tertiary system, that third ring, those are the
6 things you really see that are beginning to touch
7 people because there have not been an existing
8 application a lot of what we saw just recently in
9 that category.

10 So for us I think it is a fine way to
11 take that core and use the Cloud technology much
12 like you've seen today to extend its reach to the
13 customer knowing that it's going to take years and
14 years to develop or renovate that core, so we may
15 not have a mainframe in ten years. There are
16 probably some people right now that have a road map
17 that shows the mainframe may be in existence already
18 for 15 years. And how fast we can change that core
19 will be how we use the Cloud computing going
20 forward.

21 MS. DALE: Janice Dale. Thank you again,
22 Chairman Sheahan and Commissioners for inviting me.

1 Thank you, Chairman Sheahan and Commissioners for
2 having consumer representatives on this panel. I
3 really appreciate it.

4 As far as what homeowners and
5 businesses are looking for from utilities that Cloud
6 computing can deliver, I have to say other than
7 remote control of the appliances and basic usage
8 information, I'm not really aware of anything else.

9 We don't have people calling our
10 office saying I need this Cloud-based service, but I
11 do think we need to be careful when we talk about
12 customers that we don't describe them as a monolith.
13 They're not a monolith. Some customers want more
14 choice than others.

15 There's been a lot of talk today about
16 customer engagement and the need to engage
17 customers. I think I even heard one of the previous
18 panelists refer to continual engagement.

19 Well, part of choice is choosing not
20 to engage as well. There are customers who don't
21 want to be engaged and who actually want to keep
22 engagement at a minimum.

1 I have a cell phone here, a Smart
2 phone, and I don't even want to read all the people
3 who want me to engage with them on a technical basis
4 many times a day.

5 (Laughter.)

6 And to the extent that I do take
7 advantage of the services that my Smart phone can
8 provide, which I'm sure many of them are
9 Cloud-based, I use it to minimize my engagement. I
10 don't think that I'm unusual in that respect.

11 Obviously, there are going to be
12 customers who do want to spend the time and energy
13 on remote controlling their appliances and finding
14 out, you know, on a regular basis what their usage
15 is, but we do -- when we are talking about
16 customers, who are ultimately going to be paying for
17 these services, we do have to distinguish I think
18 between various levels of engagement and different
19 kinds of customers, because I think that's what
20 choice is all about.

21 MS. PALIVOS: Any responses?

22 (No response.)

1 I mean, how hard is it to buy whatever
2 you want to buy, a new radio, a set of dumbbells, or
3 a suit on Amazon? It takes 30 seconds to do click.
4 How hard is it in the U.S. to change a utility
5 service?

6 Okay. Ladies and Gentlemen, it takes
7 more than 30 seconds in two clicks, three calls to
8 the call center, three times on the web, it's done.

9 When we look at the level of service
10 that's going on, the Charles Schwabs of the world,
11 the Amazons of the world, the Verizons of the world,
12 the AT&Ts of the world, they are way, way ahead of
13 utilities.

14 Now let's talk about rate of change,
15 because I think this is very important. I was going
16 to take an example of a European customer that we
17 have. I'm talking about them earlier; Enel, 61
18 million meters in 40 countries, data centers in 23
19 countries, all socialist countries, by the way,
20 okay, where they have labor regimens that may look
21 like what's going on in Illinois look like nothing.

22 Okay. I mean, all sorts of terms.

1 They just made a presentation to our board. This
2 was -- who was there? Mayo Shattuck was there, the
3 Chairman of Exelon; Connie Rice was there; Spence
4 Abraham was there. In a two year -- there were 1700
5 enterprise applications that run 23 data centers
6 with 7000 employees, 1700 enterprise applications.

7 In a two-year period, Enel will close
8 down 23 data centers; in Czech Republic, in Brazil,
9 in Italy and Spain, they're closing all their data
10 centers. They will reduce their enterprise
11 applications from 1700 to 1100 and they will move
12 100 percent of their data processing -- 100 percent
13 of their data processing from grid operations,
14 customer service, AMI operations. Their demand
15 response will all go into the Cloud. SAP billing,
16 ERP system will all go into the Cloud. This is
17 happening in two years. This is the most rapid,
18 large-scale corporate IT transformation in my
19 professional experience. This will happen in a
20 two-year period of time and think about the labor
21 issue that they have to deal with in all these
22 countries, and technical issues are daunting. They

1 wouldn't even handle applications. This is
2 happening in two years. So in some places these
3 transmissions are happening very, very rapidly.

4 MR. SURBER: There are. There are examples all
5 over where people are transformed. Your point about
6 the industry, there's no doubt that the pace has
7 changed, and I think a little bit of the earlier
8 comments about choice and customers not having to --
9 instead of us having to have aspirations or one
10 customer trying to serve -- or trying to serve
11 people across a lot of different markets, a lot of
12 different customers across the food chain.

13 When you see companies making those
14 decisions around technology, one of the things you
15 find is that is not sometimes underneath -- I'm not
16 questioning at all the transportation of making
17 things move rapidly, but I think the earlier
18 education we received of Software-as-a-Service,
19 Infrastructure-as-a-Service and
20 Platform-as-a-Service is very important to
21 distinguish.

22 Also, the things that I want to talk

1 about what is called Private Cloud. We didn't hear
2 much conversation about that in the earlier
3 conversation, but a lot of the large utilities have
4 already used a lot of these technologies that are
5 available in the public marketplace, built scale
6 within their own infrastructure.

7 So the result of that, there are
8 examples where the efficiency is delivered from
9 vendors can't be cost competitive to what is being
10 done in the Private Cloud within their
11 organizations, same thing as companies like yours.

12 I do think that you can tell a story
13 in many different ways where you can say I have two
14 data centers today and I get rid of all my data
15 centers and I could take my application portfolio
16 and I can rationale it down by some number.

17 I just want to make sure that we are
18 being very careful and understand what the
19 applications are and what the impact infrastructure
20 outsourcing is.

21 I mean, today my mainframe that
22 operated a lot of our legacy utilities prior to us

1 getting the Nicor Gas market is hosting down the
2 street and down the road in Illinois.

3 There's an argument to be made, but
4 that's effectively Cloud computing. I have an IBM
5 mainframe that sits in Downers Grove, because using
6 that application in New Jersey, in Georgia, in
7 different markets to serve that customer one
8 application, that's an easy lift. Moving hardware
9 from one provider to another is an easy lift.

10 On the other hand, the customer care
11 system that's been developed over a couple of
12 decades involves multiple regulatory bodies and
13 requirements of customers in each state.

14 The business process involved in the
15 system is the long pole of ten. It's not the
16 technology, and I would love to have that
17 aspirational Cloud, that Cloud technology that I can
18 easily take and transform business processes in some
19 sort of more ubiquitous technology model at a lower
20 cost. That's a nirvana for you guys, and I wish it
21 was there today. And if it was today, I would take
22 advantage of it.

1 But, unfortunately, when you have to
2 have that level of customization, when you have to
3 have the cost implementation that would be involved
4 and entail, as well as the fact that isn't there, I
5 think the conversation about trusted Cloud provider
6 at the end of the day, I have a problem with our
7 customers' bills aren't going out the door and the
8 customers aren't getting service or not reliable,
9 I'm still accountable.

10 Now I can go to that vendor and I have
11 a great contract and I can yell at them and I can
12 call the lawyers, but, at the end of the day, I will
13 be sitting in front of this panel again
14 understanding why our company hasn't made
15 investments necessary to serve those customers.

16 So I think that is a little bit
17 different than the packaged goods industry in some
18 cases where our commitment to serve and the fact
19 that we have this regulatory oversight and I think
20 that capacity makes that burden a little higher and
21 some people are not interested.

22 I would say we were very deliberate of

1 understanding our those options, and please keep in
2 mind that a lot of the conversation that we have
3 heard today have not focused on the core of what we
4 do, the transmission, the generation, the delivery,
5 the customer care aspect of a really large system or
6 bulk of that capital investment has been fully
7 deployed.

8 MS. BARTUCCI: I think the customer system is
9 probably the most complex system we have in any
10 utility and the strategy for where we are going with
11 this very complex issue in a Cloud solution is
12 internal. It really touches every system within the
13 company and the business privacy measurement is
14 huge, so I want to validate that.

15 Just going back to I guess the real
16 core of the question, smart meters, the whole smart
17 grid has changed to what certainly in the country is
18 what we're doing as a utility. I think it really
19 brings light into a utility. Where I have been
20 there for 30 years, it's a whole new world for a
21 utility and what we're going to do in the future is
22 going to be huge.

1 So I think maybe it takes a little
2 longer to get going as a kind of a result of where
3 we have been for a hundred years, but the change
4 that we have seen over the past five years, maybe
5 ten years, depending on what company you are with,
6 has been gigantic, and I don't see us slowing down
7 at all.

8 It really is about understanding how
9 we keep this momentum going, how we take advantage
10 of these Cloud solutions, how we allow ourselves to
11 do that. The innovation that's going to come in the
12 future is going to be provided I believe very much
13 by the Cloud and we can't hold ourselves back. We
14 have to figure out how we can take advantage of it.

15 MR. TOLBERT: I think underneath that, I would
16 add we saw a bunch of examples from the first panel
17 on utilities that are making these investments in
18 Europe and overseas, and I think that's a good
19 representative piece to this that if other places
20 are doing it, the question is is whether or not U.S.
21 utilities will do it and will move as fast.

22 I think the first answer to that

1 question is or the first part that I would say it's
2 clear that we're not doing it as fast as folks in
3 other areas are. I would say in deference to you
4 the one difference is I would rather change my
5 utility service than my cable service.

6 (Laughter.)

7 At the end of the day, I'm still
8 getting bills by Comcast three apartments ago for
9 some reason, but I think the sort of piece that's at
10 play in the other analogy that I would use this is
11 that there are times that are out there when
12 industries have to make a decision of the path
13 forward that they're going to take.

14 The telecom industry was it going to
15 be an industry that was driven by land-line service
16 or was it going to be an industry that was driven by
17 wireless service.

18 I think most of the big telecom
19 companies will tell you they made the right choice
20 by actually going towards the large focus on the
21 wireless service. I think sort of the further
22 evolution of that though has been to bring your own

1 device phenomena that's occurred within the telecom
2 industry and the different places that you can walk
3 in with any cell phone you want and you can get
4 service with that provider, and that's really sort
5 of where it's going.

6 Consumers are demanding choice and
7 demanding technological innovation and not everybody
8 jumps into it. There's that five sort of level of
9 adopters that are out there, but that first sort of
10 one and two segments of those early adopters really
11 tend to drive a lot of the process that's ongoing.

12 So I think that the utilities have a
13 lot of reasons that the utilities have concerns and
14 I think many of those are very valid.

15 I think the fact of the matter remains
16 though that we are slower to adopt here in the
17 United States than we are in some other places, and
18 I don't think that the sort of charge or the desire
19 to make sure that we maintain reliable service is
20 different in any country versus another, and what we
21 saw from the slide that we saw earlier, some
22 countries are doing a better job of that than

1 others.

2 MS. DALE: In terms of new IT approaches, again,
3 I have to come back to these customer issues,
4 because now we are talking about yet another
5 customer. There's the utility customer and there's
6 an end-user customer variation within those groups,
7 but certainly in terms of IT approaches that are
8 being utilized simply for operational purposes, I
9 think Illinois is well on the right path to
10 implementing whatever is the most efficient kind of
11 technology out there, the Commonwealth Edison and
12 the Ameren, to spend money on metering technology,
13 and peak changing technology, and facility storage
14 technology.

15 So in terms of purely operational
16 technology, I think we are well on the way. The law
17 is in place. The money is there. They're able to
18 spend it and hopefully they make the right choices
19 and pick the most efficient technology.

20 As far as consumer-based technology, I
21 think we are still years away from that, and what
22 will happen, again, I'm not getting calls about that

1 at the office, but it seems to me that the framework
2 is in place to do that and the money is there, and
3 it will be interesting to see what sort of products
4 people come up with.

5 MR. SURBER: Let me talk for a little bit. I
6 don't think that any of us go into technology -- we
7 don't go into a technology decision and start
8 worrying about how we are going to pay for it.
9 First intent is to figure out the best way you can
10 deliver the solution. Whenever there's Cloud
11 opportunities available, you can bet that everybody
12 in our seats is trying to understand how we go in
13 that direction.

14 I believe the inevitability, the 10
15 year, 20-year forecast, and that's one of my biggest
16 concerns is that as a buyer of technology you used
17 to be offered only the traditional model and then
18 they came and said let's make a hybrid model. Let's
19 run it and we will run it for you and you can't own.

20 Well, now there's a scenario where we
21 have major applications that are in the core that
22 are now subscription-based licensing, so even though

1 it's not Cloud, the licensing model is adapting or
2 moving to a Cloud, I would say, prepared state so
3 that you get into this mind set of subscribing to a
4 license that you pay for and expense with the intent
5 that at some point when they build that core and
6 have that Cloud available, you will be able to move
7 to more seamlessly. Now that's something that you
8 can almost see, like training wheels stick out, to
9 kind of move people in the direction of those large
10 core systems.

11 I do think that there are -- the one
12 area that people are being very mindful of are
13 things that you are not uniquely qualified for and
14 making the argument that a utility is uniquely
15 qualified to deliver E-mail or to deliver any kind
16 of other horizontal market-based solution is
17 something we like to leave our business out of.

18 I don't think it's benefitting us or
19 the customer not to provide that, but it's very key
20 to our operation, and that is an area where over the
21 years, I think the Commissioner's point, we have
22 invested a lot of capital and infrastructure to

1 deliver those what I would call productivity or
2 non-core systems, and we would have to make a hard
3 shift to change the direction of that, and there is
4 an implication at least in the current financial
5 ratemaking process that we would have to deliberate
6 about understanding what the implications are in the
7 short-term.

8 MS. DALE: As far as privacy concerns, how much
9 exactly should a utility be outsourcing and perhaps
10 putting data at risk?

11 MR. SURBER: That's absolutely a concern. You
12 know, I always joke that these technology guys are
13 first at the party and lawyers are catching up,
14 because all of a sudden everybody's running, leaving
15 stuff out, and the lawyer's like do what with the
16 data, and they kind of have that moment, but one
17 thing I think about the data, I am confident that
18 the industry understands the obstacles.

19 When I say "industry," the technology
20 industry understands the obstacles, especially to
21 serve government, to serve utilities, companies that
22 have that high degree of security. I do think that

1 there's solutions out there.

2 I know that like in certain states
3 like the State of Georgia where the State of Georgia
4 has gone into that Microsoft Cloud model for E-mail
5 and the like, they have a -- Microsoft set up a
6 Cloud within a Cloud and they're in Cloud within
7 that Cloud, I mean, so they layer to the point they
8 can insure some of those concerns.

9 I think that's an area where I would
10 hate to just be a naysayer or roadblock for that
11 thinking only for the fact that I do think that
12 there's some opportunities for the industry to
13 collaborate and solve some of those problems.

14 MR. SIEBEL: If I could amplify that, Joe,
15 virtually all of these requirements that we were
16 aware of around the world are being deployed into a
17 virtual private, secure Cloud infrastructure. Sure,
18 they are very much dedicated to organization.

19 As far as security as an issue, when
20 we see the National Security Agency moving major,
21 major pieces of IT operations into Amazon, into
22 Amazon web services, and, I mean, this has been --

1 this is great security. They have contracted with
2 AWS. This is where they're moving major chunks of
3 data and the data processing, because even the NSA
4 doesn't have the capability of processing the data,
5 and so if NSA can't do it, I'm not sure what the
6 chances are for utilities.

7 MS. DALE: Tom, if I could ask a question --

8 MR. SEIBEL: Yes.

9 MS. DALE: Could you explain or can anybody else
10 explain what it is about the Cloud that would make
11 it more secure than keeping data behind a utility's
12 firewall? Is that something that -- I don't
13 understand, and I'm not sure if other people here
14 understand it either. We have been talking about it
15 with that assumption in mind that it is more secure,
16 but I would like to hear an explanation as to how
17 and why --

18 MR. SIEBEL: We almost couldn't define a less
19 secure place to put it than behind your own
20 firewall. In other words, it used to be in the old
21 days when we used to use something called core
22 memory, okay, and you kind of needed a forklift to

1 move the data in the building, you don't need a
2 forklift any more. We basically need -- anybody can
3 walk off with all the top secret information of the
4 Department of State, okay, whether it's behind their
5 firewall.

6 If you put it into cyberspace, the
7 technology suggest -- I mean, I'm going to meet with
8 you and go along on this with you, but we have gone
9 through all the security compliance and sit through
10 this. We have PG&E, FUG, and others, all this
11 security and they had tried to penetrate these
12 systems, they can't penetrate, and you can put it
13 there where, I mean, you can't get at it behind the
14 firewall. Anybody can get at it, and we're reading
15 about it every day. So it is perhaps in the future
16 the only place where you can secure the data.

17 MS. BARTUCCI: So from the utility perspective, I
18 think that there are security risks no matter where
19 you are. I would agree just because it's in the
20 Cloud that it would be more secure. I think it's
21 about really defining what security looks like
22 regardless of where your data sits, and having those

1 expectations, again, regardless of where your data
2 sits or access to those systems, we have to make
3 sure that we prepare ourselves internally and we
4 have to hold the vendor accountable, whether that's
5 contractual, whether that's allowing us access to
6 pen test their system or tell them what you're going
7 to expect of them, they still have to be able to
8 prove. We have to know that our data is going to be
9 secure. We have to hold everyone accountable
10 internally and externally.

11 I think what the Cloud does bring to
12 us is they bring dedicated resources to support
13 those systems that they already are the experts on,
14 so, whereas, I have many, many people doing lots of
15 different things, they are going to be able -- I
16 would expect that the Cloud is going to be able to
17 patch their systems whoever that vendor is. They
18 know their system.

19 I have seen vendors react overnight to
20 problems that have been identified. We hear about
21 things that are happening in the industry, some
22 virus or some incident, and they can turn around

1 overnight and protect our systems. I think they
2 have that reaction capacity that I might not have.

3 MR. TOLBERT: I think another way to frame this
4 is we talked quite a bit about core competency and
5 part of being in the software business, being in the
6 Cloud business, that secure -- making sure that
7 that's secure is one of the things that is
8 considered a core competency that they have to be
9 able to do. You have to be able to do that even
10 before you can even pass the smell test, so to
11 speak, and as a utility, it's one of many things
12 that the utility is doing and there is a firewall
13 and the people doing that work it's a core
14 competency, but it's not necessarily the thing that
15 the utility is most focused on, even though the
16 utility has a deep commitment to it.

17 I think that's the other piece to it.
18 I don't want to undersell a utility's commitment to
19 protecting the data at all, but I think that these
20 companies that's a big piece of the way that they
21 have built their brand and built who they are.

22 MR. SURBER: I'll just add a couple of points. I

1 agree absolutely with the comments that the people
2 are the weakest link in the security. Where there's
3 a will, there's a way. It's impossible to protect
4 everything. You keep a locked room. You get the
5 key.

6 I think another analogy I have heard
7 used today is the Cloud computing when it first came
8 out was called a utility computer, and when you
9 think about how the model's predicated, you have got
10 a whole utility industry set up on the fact that's
11 it's better to build in mass and distribute as
12 opposed to having everybody go and put a power plant
13 or gas service in their home every day, and so I
14 think you go back to highest and best use, and,
15 again, it's aspiration, the idea being that people
16 that are best at running the infrastructure run the
17 infrastructure and the people that are best at
18 running applications run applications.

19 Unfortunately, what are the
20 aspirations to be realized? Right now we don't have
21 that option. I don't think anybody that's sitting
22 in our seats can say they're in a position right now

1 where they can transition from the existing
2 environment to the Cloud environment across
3 alternate application platforms. It's just not a
4 reality right now.

5 I do think there are opportunities
6 abound, especially as new technology is developed.
7 AMI is a great example. AMI wasn't around 20 years
8 ago. It was in its early stages, AMR. Now it's
9 evolved into AMI. It's crazy. Do the math. Data
10 problems didn't exist a couple of years ago. That's
11 a problem. They were looking for a solution, but
12 that problem and that solution both came available
13 at a time where there was no solution. There was
14 something else called the Cloud.

15 if we would have had that solution or
16 that problem brought to us a decade ago, that's what
17 they would have done. They would have build up a
18 lot more infrastructure, and so the only place that
19 you see people trying to still make that commitment
20 or that investment is in areas where they don't have
21 as much choice as maybe to consider or what people
22 thought was conventional.

1 MS. BARTUCCI: I just want to add one more point,
2 just because it's in the Cloud doesn't mean that IT
3 or a company would not have an interest if there
4 were issues.

5 So I just picture my face squirm if
6 something happens to the vendor I use. We have a
7 very significant security department that's not part
8 of IT. It's part of the whole company. It does all
9 security and if something does happen there, they're
10 on it, so regardless of who's hosting it, they're
11 going to take that same responsibility.

12 MS. McCLERLEAN: Thank you.

13 Our next question will be what have
14 the been the major impediments to faster progress in
15 the area? What are the regulatory, legislative or
16 other policies?

17 MR. SURBER: I think we already jumped ahead a
18 couple of questions. I think on a couple of fronts,
19 I do think first and foremost that the impediment is
20 that the solutions are not all available. I mean,
21 right now there are certain core systems and
22 technologies that we have employed to meet the needs

1 of our customers in line with expectations of our
2 stakeholders and our regulators, et cetera, that we
3 do not have an alternative for.

4 The alternatives are still in that
5 model that Tom described as 20th Century, and
6 unfortunately, the level of investments we make
7 those systems that we don't overburden the customer
8 with cost, in addition to the fact that people are
9 making decisions right now on a 10-year road map
10 with having to make decisions with tools they have
11 available today, and so I can't just necessarily
12 press pause and wait for the market to come to us
13 and not serve the customer during that gap.

14 So I think they are trying to look at
15 a lot of the architecture that people are
16 considering is how do they build these systems in a
17 fashion using things like service-oriented
18 architecture and the like that would allow them
19 easier transition to that aspirational Cloud once
20 it's fully available.

21 I would probably say that's how we are
22 sitting today and I do think that there's no doubt

1 that utilities have largely been building
2 technologies much like the utilities that would
3 build a pipeline or anything else in that you have
4 to build and operate a model. You build that
5 capital -- those capital dollars and operate in the
6 expense world, and you want to make sure that, at
7 least I tried to, make sure that IT is widely
8 involved and that if you go into a ratemaking
9 proceeding or if we talk about how we are going to
10 budget or notify your claim for the utility, you
11 don't want wildly shifting IT costs to be a reason
12 we have to come back and rethink that plan or
13 rethink how we are going to set rates for our
14 customers.

15 So I do think that in the
16 demonstration that you talked about is understanding
17 how we can kind of change the scene so that if it
18 does become available you can move to it without
19 having to say I have -- where I'm more able to move
20 without causing any kind of undue consequences would
21 be a welcome addition as we look at understanding
22 what the technology market will provide.

1 MR. SIEBEL: So I am going to set myself up here
2 for Janice to beat me up.

3 (Laughter.)

4 I don't think there's any question
5 that the largest impediment to innovation as it was
6 to take advantage of this new generation information
7 technology into the utility industry is the
8 regulatory structure of the industry in the United
9 States, and it is true, okay, that it is a fact that
10 if a utility purchased technology -- information
11 technology that was invented in the 20th Century,
12 okay, they get a return on that investment. Okay.
13 If they have purchased technology that was invented
14 in the 21st Century, they do not get a return on
15 that investment. Okay. It's simple. Okay.

16 So, basically, all of these
17 Cloud-based software service solutions which are
18 charged having -- when a licensing model happen to
19 be a true model subscription, licensing model having
20 not been in the consideration stage -- had not been
21 in the consideration stage changing with the energy
22 bill that's coming through Washington, this is

1 changing because regulators are paying attention to
2 it, as you are, and you are out in front, and this
3 is changing really new accounting regulations, so it
4 is with FASB, but I think unquestionably that has to
5 be based on that.

6 As it relates to the ability -- our
7 ability to do this, let me take a case in point in
8 the U. S. Exelon Company, okay, that's involved in
9 our gas and electric, one of the three Exelon
10 operating utilities, okay, we loaded all of their
11 customer data, all of their billing data, all of
12 their media data, all of their head-end data, all of
13 their maintenance history, 60 billion rows of data
14 into the Cloud infrastructure. It has been
15 operational for a year. It runs all AMI operations
16 and revenue protection from Baltimore Gas &
17 Electric.

18 The economic benefit to the consumers
19 at Baltimore & Electric is \$20 million per year. In
20 the first six months, we identified 450,000 meters
21 that would have resulted in billing errors. So we
22 did it. It's live. It's operational. And let me

1 tell you these guys at Exelon are no slouches when
2 it comes to security issues. They are all over it.

3 Okay. They had to pass every
4 penetration test, SIPC compliance. Okay. It had to
5 make sure the data is secure. The system has been
6 provided with 100 percent reliability --
7 availability for the past 12 months, and there have
8 been no security breach issues, and the way we got
9 that done is we licensed it under a 20th Century
10 licensing model. That was the way to go.

11 MS. BARTUCCI: So, as I'm thinking about this
12 question, I think we did talk about security quite a
13 bit, but for us, the utility, again, I feel like
14 we're moving so fast, yet, I realize that we aren't
15 moving all that fast but, for us, I feel like we're
16 moving very quickly.

17 So the two things that I thought about
18 were security, so we -- I mean, we bring power to
19 your house, right? When people want that power on,
20 we cannot take any chances with our systems. We
21 cannot. When we lose power, the power needs to come
22 back on as quickly as it can.

1 So the system -- if we were going to
2 go to the Cloud on some of our core systems, we'd
3 really need to make sure that there's no risk to
4 security, like that system has to be available all
5 the time, and this is where we do have the core
6 competency. We run these systems really well. I
7 would say the security reliability issues is one
8 thing that would prevent me from moving very
9 quickly. We need to be cautious, because it works
10 really well right now.

11 I will talk a little bit about the
12 capital account, so right now we do have it in our
13 five-year budget -- home budget building period, and
14 our first thought is not how am I going to pay for
15 this. It's not what is the solution.

16 What is it we're trying to do? What
17 is the business design the IT person trying to form
18 a business. It's really about understanding what
19 are our needs and that's really the first question,
20 and then when it comes down to what I'm planning, I
21 only get so many expense dollars, right. Expense
22 dollars are scarce. We protect them. We conserve

1 them.

2 So when I'm looking at my five years
3 out, I'm looking at my five-year plan. I'm looking
4 at these small dollars, and I really have to
5 understand is the Cloud even in my future. I cannot
6 use capital dollars to purchase the Cloud. I really
7 have to start planning for the next five-year
8 window. How long am I going to depend on this
9 system.

10 So I know a lot of my colleagues,
11 who's on the next panel, who have the regulatory
12 background, but we really have to figure out how are
13 we going to be able to do this. It's all about
14 innovation. It's about figuring out the systems of
15 the future, and we do have to figure out how we are
16 going to pay for it.

17 MR. TOLBERT: I would add one thing that sort of
18 I think is a mix of both what you two were saying,
19 one of which is that if we address the regulatory
20 hurdles that are there and the accounting hurdles
21 that Tom mentioned are addressed, if we address
22 those, we will create an enormous market opportunity

1 for these Cloud-based providers. Regardless of
2 whether or not we can go 100 percent to the Cloud
3 right now or not, there is an enormous opportunity
4 that is untapped because of the regulatory structure
5 that exist in the country right now.

6 So, you know, I think that's the big
7 piece that I would just want to flag is that if we
8 just look at what are the opportunities for the
9 utility to be able to actually earn off of that
10 investment, what are the opportunities for them to
11 be able to make money and for these Cloud services
12 to make money and knock down some of those
13 regulatory barriers, we are going to create an
14 enormous opportunity for the Cloud service providers
15 that are here today as well as an enormous
16 opportunity for utilities even if we can't go a
17 hundred percent to the Cloud tomorrow.

18 MS. DALE: I hate to disagree. As far as the
19 impediments to past departments, I would have to say
20 I don't see the impediments that you see. I don't
21 know of any law or Commission regulation that is
22 technology biased. Everything is technology

1 neutral.

2 I'm not aware that technology invented
3 in one century is somehow favored over technology
4 invented in another century, which is what I heard
5 you say. I think that, you know, we have the laws,
6 2.6 million for ComEd. They have guaranteed cost
7 recovery. They have guaranteed recovery of their
8 investments. They have a guaranteed recovery rate
9 of return on that investment.

10 So as far as cost or financial
11 impediment, I don't think they exist in the way that
12 you describe, unless what you are suggesting is
13 that, and I don't know if this is what you are
14 suggesting, that utilities be permitted to earn a
15 return on their expenses.

16 I don't think that's what you are
17 saying, but in terms of whether or not a utility can
18 make responsible decisions as a monopoly provider, a
19 provider of essential services, as to what to invest
20 in and what to expense, I don't think, at least in
21 Illinois, those impediments exist. From the
22 regulatory perspective as well, we have been working

1 on the Smart grid infrastructure since 2007.

2 There are four dockets. I think the
3 Commission is now on its fourth docket in terms of
4 dealing with data access issues. Those are moving
5 along. Our office and other advocates have
6 participated in those. I certainly don't see the
7 Commission standing in the way of moving toward a
8 place where customers can have access to different
9 kinds of products that they so choose, so I don't
10 see those impediments.

11 I think the only thing left to be
12 addressed is to the extent that utilities choose to
13 invest in technology, whether they're Cloud-based or
14 not, that would facilitate the innovation that has
15 been referred to here.

16 Who should pay for that? In terms of
17 customers who want those products and customers who
18 don't want those products, I think that hasn't been
19 settled to the extent that utilities need to make
20 the big investments, but not all customers are going
21 to benefit from that investment. They choose not to
22 buy certain products. I think that that still has

1 to be decided.

2 But, as far as I can see from my
3 perspective, we are moving. I don't see any
4 specific impediments. I don't run across any
5 specific impediments from the regulatory perspective
6 or the financial perspective that I have heard from
7 utilities.

8 MR. SIEBEL: Janice, with all due respect, and
9 you are an expert regulatory matters, I assure you I
10 am not. With all due respect, let me deal with an
11 example that's not related to utility operations.

12 Let's talk about customer service
13 applications. If a utility purchases a customer
14 service application from a company like Oracle or
15 SAP and they install behind their own firewall and
16 they have a perpetual license and that is through
17 your regulatory spectrum, that's MX, okay, and that
18 is -- it will get you a return on that investment.

19 If they're purchasing an equivalent
20 system that was developed in the 21st Century of say
21 Salesforce.com, there's a Cloud-based software
22 service, that is by definition Com X, okay, and they

1 do not get a return on that investment, for that
2 reason they tend to be much more predisposed towards
3 investing in things that they get a return on
4 investment.

5 Regardless of the reading into the
6 law, I can assure you with a hundred percent
7 confidence this is the way utilities in United
8 States are in trouble.

9 MS. DALE: Well, you know, I think it's the role
10 of the vendors to convince whoever needs to be
11 convinced whether it's the utility that a particular
12 investment is a prudent way to go, and I think this
13 forum is a good example of how you make that
14 argument, but I don't think we can lose sight of the
15 fact that utilities are monopolies.

16 They do have a core mission of
17 providing essential service, and to the extent that
18 utilities need to consider how many expense dollars
19 they have and how many capital expenditure dollars
20 they have, they have to take that into
21 consideration, because they are maintaining the
22 system for everybody and not just for select groups

1 of people, and to the extent you can convince
2 utilities that this is a more efficient way of
3 working, I dare say that they'll listen and
4 certainly the regulators.

5 MR. TOLBERT: I just want to add, I don't have
6 all of the background on this, but I can tell you
7 there are folks from Enernoc, OPower, FirstFuel, all
8 of the folks that were on that first panel that
9 addressed some of these issues, there's a couple of
10 things that tell me that there is an issue.

11 One is that even with adjustments to
12 the standard accounting practices -- I don't know if
13 that is a hundred percent the right way to describe
14 that, but the new document on accounting practices
15 that came out this year, there are some high hurdles
16 that are there for investments for the utilities;
17 second, the federal energy bill that Tom referenced
18 earlier is attempts to try to take down some of
19 these hurdles to make it easier for utilities to
20 make these types of investments.

21 And while I wish that -- I wish this
22 moment in time -- you'll never hear me say this, and

1 my friends in the crowd know me. You know, you will
2 never hear me say this. This is the one time I
3 wished that I worked on federal policy so that I
4 could help answer this question, but this is
5 something that there is a movement afoot at trying
6 to figure out. There's some things in the meantime
7 recognizing that the federal energy bill was not
8 going move that states can do to address these
9 issues.

10 And, once again, I applaud the
11 Commission for having this conversation to start to
12 get at that.

13 MR. SURBER: We talked about this internally.
14 When it comes to the impediments, you look at it
15 through a couple of different lenses, but maybe you
16 can make the argument. I look at that as more of a
17 practical sense of, you know, take an example where
18 you found some of PDD, so PDD they use a lot of
19 Cloud technology. They're doing that stuff without
20 a second ring of the system so that the core of that
21 PDD operation is that CC&B is an application of
22 Oracle, which is the 20th Century model, and they

1 have invested it out -- I am not an expert, but they
2 invested tens of millions of dollars over the
3 decades building that system and the processes to
4 support that.

5 So an example Tom is saying, hey, you
6 cut the core. I can compliment the core with a
7 Cloud-based solution. He can do that very quickly
8 and it goes in, but it's not an asset of a utility.
9 It's a service I'm providing. And so when I provide
10 that, all of a sudden that's going to that expense
11 line, and, again, I think -- and I'm not a rate
12 expert or a regulatory expert -- and speaking to
13 them right now, but I think that's where the example
14 would be.

15 For right now we have gone and built
16 these models to deliver efficient customer care,
17 employee-driven services as efficiently as possible
18 within the regulatory confines, and the fear is that
19 all of a sudden you take something that yesterday
20 was an asset and now it's an expense, then what do I
21 do then?

22 I'm not the rate-making person. I'm

1 the CFO and I'm going in and I'm trying to deliver
2 the best services I can for the customers and
3 employees, but I don't want to make a misstep that
4 all of a sudden causes somebody else to come down
5 and start talking about the impact decision on how
6 we are going to effect rates to the customers, et
7 cetera, et cetera.

8 That's just one part that's a little
9 bit of a slippery slope that I think we as
10 technologists are trying to navigate every day. I
11 think we're right. We want to make the right
12 decision and I know vendors come to our office every
13 day and they understand the confines of the
14 regulatory environment. And the reason that Oracle
15 hasn't gone and invested in moving CC&B to
16 Cloud-based solutions is because nobody would buy
17 it.

18 MR. SIEBEL: Maybe, again, if you do a Google or
19 Larry Ellison, they're investing in other solutions
20 basically saying these Cloud-based solutions where
21 the customer has the right to take possession of it
22 are to be dealt with as CapEx, that they are the

1 property of the customer and they are CapEx, and
2 that just hasn't made it through the industry yet.
3 As it relates to the energy bill we work with,
4 that's a done deal. That is a common law.

5 MR. SURBER: It is. It's interpreted as to an
6 actual ongoing expense.

7 MR. SIEBEL: It's CapEx. It's certainly a new
8 expense over time like any other capital
9 expenditure. As it relates to the energy bill, we
10 worked with the House Energy Committee and Senate
11 Energy Committee on this basically to the extent to
12 which t encourages the state regulators to give
13 strong consideration to these new generation of
14 Cloud-based software service technologies to the
15 extent to which you just happen to be out in front
16 of it.

17 MR. TOLBERT: I think that one of the things that
18 folks hear I think that there's probably -- and I
19 could be misspeaking, and it wouldn't be the first
20 time -- but I think one of the assertions that a lot
21 of folks would make is that utilities should be able
22 to make money by improving service, improving

1 customer experience, and also delivering the product
2 and everything else, and performance should also be
3 a driver in the utilities -- in the way that
4 utilities make their profits.

5 MS. DALE: And that is, in fact, to be the case
6 in Illinois.

7 MS. PALIVOS: Okay. We will now take questions
8 from the audience, and Commissioner Maye will go
9 first.

10 COMMISSIONER MAYE: I think this is a fabulous
11 panel and I compliment my colleague, Chairman
12 Sheahan, for having the brainwork to get us all
13 together.

14 I agree. I know, Janice Dale, you
15 mentioned that not everybody wants to be engaged.
16 The key is customer engagement and that kind of came
17 across a lot in the first panel, first engaged and
18 OPTIC engage, and all that. I think that that is
19 true. It's the key. Everybody wants to -- at the
20 end of the day, all consumers want to save money.
21 That's the old Russian theme that in order to save
22 more money, saving more resources. That is the key

1 step, and the first step is engagement.

2 So I guess this is two questions.

3 Some of it was addressed a little bit earlier, and I
4 understand we are going to address it in the next
5 panel as well, but the first part of my question
6 will be what is it that can be done or what are you
7 trying to do more of? What kind of outreach are you
8 doing to make sure that that percentage of customers
9 that are not currently engaged or maybe they don't
10 want to be engaged?

11 I don't know if they don't want to be
12 engaged. I think it's one of those things that you
13 don't know what you don't know about. If you know
14 how to save money, you would be getting engaged.

15 So what is it that you are planning to
16 do or what can be done, and even from a regulated
17 perspective, what can be done to get to that group,
18 that not engagement group. I shouldn't say the
19 disengaged group. It's not that they don't want to
20 necessarily be engaged. They're not engaged, but
21 for whatever reason they don't care what their
22 neighbors' rates are and things like that. They're

1 not that concerned.

2 So what is it you are going to do?

3 Second, I think just as important as consumer
4 engagement is regulatory engagement.

5 Let's kind of push the Illinois
6 Commerce Commission aside for a second. Let's just
7 talk nationally, regulators nationally. It's truly
8 important, and you touched on this a little bit, to
9 make sure that that regulatory framework is
10 understood, and it's understood that in order to
11 have, you know, these next level of technologies --
12 technological improvements and advancements, which
13 would at the end of the day perhaps lower rates for
14 a lot of our consumers, you have to have a
15 supportive regulatory environment. So what I guess
16 from a regulator point of view could we be doing
17 more of? Thank you.

18 MR. TOLBERT: I would like to jump in with a
19 consumer engagement. I believe that it's OPower
20 that the story or this example works for, and if
21 it's Enernoc, I apologize. I know it's one of the
22 two of you, but when you see a high demand day

1 coming and the utilities see a high demand day,
2 these guys have the ability to be able to send
3 E-mails or to send a note to -- an electronic note
4 to a consumer saying that we expect super high
5 demand tomorrow and here are three ways that you can
6 actually save money and reduce demand at your home,
7 which home makes me think it happens to be OPower,
8 but that's a way that there's actual engagement,
9 right.

10 So because of their partnership that
11 they have with the utility, they're able to
12 communicate that out to a homeowner and the
13 homeowner then is able to make the decision of
14 whether or not they actually want to -- whether or
15 not they actually want to engage.

16 OPower can give you the stats, but the
17 stats are actually really, really good on the number
18 of people who do lock into those programs, and we
19 have seen that this happens time and time again. So
20 they may not care what their neighbor is doing on
21 that day, but there's been a direct communication to
22 them letting them know that they have the ability to

1 be able to save money and help overall if they take
2 action tomorrow.

3 One of the things that I sort of in
4 the very first question that I started to say was
5 that homeowners, folks, apartment research, whoever
6 it is, I want all of my bills, and not everybody
7 wants this, but I want all of my bills to come on my
8 cell phone. I want to be able to pay them on my
9 cell phone. And if you, as the utility, shoot me a
10 note via my cell phone that says, oh, if you do X, Y
11 and Z you could save yourself some money, then
12 that's a way that you are going to get me to take
13 action, right, calls like that and not to call
14 anybody out. You can just look out in the crowd and
15 see the number of people who have looked down at
16 their cell phone. People live on those devices, and
17 we take action based upon what comes in on those
18 devices. Many, many of us do, not everybody, but
19 many of us do.

20 So I think there are those tools,
21 those resources that allow engagement and that
22 communication and having those tools helps to drive

1 the larger adoption from consumers.

2 MS. BARTUCCI: I'm just going to panel in, and
3 since I'm not in a customer service organization,
4 but that is one of our primary goals. How do we
5 reach outside to our customers? How do we get the
6 programming or the -- how do we incent them to take
7 part in a lot of these programs that are off the
8 footer, whether you are managing your power,
9 understanding where power usage comes from? If it's
10 billing, how do we allow their bills to come to them
11 the way they want it to be done? How do we let them
12 Tweet or get on Facebook, or to know what's going on
13 with their power?

14 We also don't want -- I know there's
15 certain things you don't want to know about though.
16 I think there's a certain percent of the population
17 we're not going to reach, because they have no
18 desire, and I think you have to acknowledge that,
19 but the rest of them it is power getting information
20 on the bill, getting little footnotes. How can you
21 get more information? How can you get more data and
22 really just making it easy for them to do it?

1 I know for me personally, I go to -- a
2 facility sent me a website to go and sign up for
3 something. I tried it once. If it doesn't work,
4 I'm done, because I know it should be that easy,
5 right, Amazon. You know, there's nothing you can't
6 do with Amazon, but it's so easy. You have to make
7 it easy for people. You have to make it so simple
8 that they use it, just like they use Amazon.

9 MR. SURBER: So the secret to success of Amazon
10 is it's not a fragmented market. Go to Amazon and
11 you can buy anything. You can buy a book. You can
12 buy a TV with your name on it, and I think one of
13 the challenges we try to reach out to our customers
14 is if you have a water company, a gas company and an
15 electric company, you want to reach the customer.
16 So when you are trying to decide to engage a water
17 company, an electric company, or a gas company, I
18 think that's where one of the things can be provided
19 systems that are going to be accessible to whoever
20 captures that end-use customer, so I think one of
21 these things it may end up being us. We may be the
22 best at it.

1 The argument may be that Google or
2 somebody like that may be better at it than
3 utilities. How do we provide system and technology
4 to the data? We talked about data that makes that
5 customer touchtone value so they can then find a way
6 in a mobile environment or whether it's a web
7 environment or old fashioned rate environment that
8 they can engage with their energy choices as they
9 choose.

10 I think from a regulatory perspective,
11 it's understanding what the idea was for the
12 customer and how do the utilities not make sure
13 they're not holding that up so they might not be an
14 impediment to allow customers to engage.

15 Right now, without there being a
16 single point of contact for customers to make those
17 kinds of home-based energy decisions, there's a lot
18 of people like you saw earlier competing for that
19 lion's share, competing with us to choose to get in
20 front of the customer, and then I think as well
21 we're all competing just within our own -- within
22 the utilities. We're trying to make sure you are

1 providing the best on-line customer care presence
2 easy if it involves one call solutions.

3 It's easy to sign up for service. So
4 providing a system a lower competitiveness that no
5 matter who's the best in doing that, we can plug in
6 and provide the data necessary. I think that's
7 really important.

8 Another thing that I want to go back
9 just a little bit and talk about, another benefit of
10 the Cloud we heard about today, we've heard a lot of
11 software service and companies talk about one of the
12 key infrastructure service is the idea of rapid
13 provision and timing the market.

14 An example right now, if I wanted to
15 build an application, Let's say that the Regulatory
16 Commission say you have got a great idea; we'd
17 really like to invest in this. So we've got
18 clearance and we got -- we say let's start. You are
19 going to do the requirements, which takes a little
20 bit of time, but then one of these days you are
21 going to procure the system.

22 You have to set up those systems. You

1 have to install those systems. You have to provide
2 for disaster recovery for those systems. That lead
3 time is not anything that necessarily happens
4 overnight for those who provide the Cloud
5 capabilities to offer that.

6 Imagine the day where you say go, we
7 have got the environment stood up to start the
8 project in less than a week, some cases less than a
9 few hours. That's again that aspirational view of
10 the Cloud that people want, but that's the example
11 where in an existing regulatory confine if you don't
12 have that outlet available to you, you have to go
13 buy or procure, set up and install, but if I get a
14 request on a Monday that we want to go innovate for
15 customers or do something beneficial, I can test the
16 availability to hit the ground and no longer be an
17 impediment or obstacle as part of that process.

18 MS. DALE: I would just add one brief thought.
19 Sometimes customers' priorities are not just to save
20 money but to save time, and I think that the notion
21 of continual engagement impedes customers being able
22 to save that time.

1 If I use my phone to do banking, it's
2 because I'm trying to save time and minimize my
3 engagement, and I think that that has to be taken
4 into consideration when utilities make their
5 decisions on how to invest because everyone who
6 winds up paying for -- everyone winds up paying for
7 services that only a small number of people use.

8 We know from the ComEd, AMI pilot that
9 the level of engagement for all those hustles in the
10 pilot were relatively small. It was 7 percent, and
11 sometimes that's really all you need to make a
12 difference in rates and prices for everybody just to
13 be that 7 percent engaged. We do have to be mindful
14 of who will pay for investments that will benefit
15 possibly just a very few number of people.

16 CHAIRMAN SHEAHAN: I wonder if we could explore a
17 little bit more of this question of expensing
18 on-premise systems versus expensing Cloud-based
19 systems.

20 Janice, you offered an example of
21 banking on your mobile phone which banks do in the
22 Cloud because the cost per transaction is pennies

1 versus dollars for a live in-person interaction
2 transaction.

3 The reason businesses are adopting the
4 Cloud is because the economics are so telling.
5 Utilities don't operate under sort of the normal
6 pressures that other businesses operate under,
7 right. Theirs is sort of -- their economics are
8 governed by primarily regulatory signals.

9 So I'm hoping the panel can kind of
10 help us understand a little bit about the economics
11 of Cloud-based services versus on-premise services.
12 I think what I have heard this morning is that the
13 future of the grid, which is going to be
14 distributed, is going to be complex. It's going to
15 be two ways. It will demand a level of sensing
16 and analytics that utilities don't currently possess
17 necessarily.

18 Under the current sort of framework we
19 have, they can make those investments. They can
20 invest, you know, billions of dollars in building
21 out those systems that they would have in racks in
22 their computer rooms, and ratepayers would pay more

1 for that than they would for a comparable system,
2 which I think most people agree will be necessary at
3 some point in the future that would be Cloud-based.
4 So the rate -- the impact on ratepayers will
5 actually be higher in the long term, I think.

6 If utilities are required to actually
7 house these services themselves as opposed to using
8 these services in a Cloud form, which in all other
9 industry sectors wherein they're going toward the
10 Cloud, you know, they're doing it for those, you
11 know, really compelling economic reasons.

12 So can we have the panel sort of
13 address that question.

14 MS. DALE: I understand exactly what you are
15 talking about, Commissioner Sheahan, and I have
16 thought about this and, obviously, from the first
17 panel we heard about a lot of different services
18 that are out there that utilities could take
19 advantage of that would make the provision of
20 service to their customers more efficient and more
21 cost beneficial.

22 But to the extent that there are third

1 parties out there who will have services to sell to
2 utility companies and to the extent they use utility
3 assets, I do think in order to do that, I do think
4 we need to think about having third parties
5 contribute something toward the assets that they're
6 using and right now, as far as I know, there are
7 companies out there who sell services to utility
8 customers or will be selling services to utility
9 customers in the near future that make use of
10 utility data and utility assets, but they don't pay
11 anything for those assets, in fact, they're simply
12 piggybacking on assets that ratepayers pay for.

13 So to the extent that third-party
14 profit-making utilities are offering services that
15 they make money on, it seems to me that part of the
16 new paradigm, if you want to use it that way, would
17 involve those companies contributing something
18 toward the assets that are being in place.

19 CHAIRMAN SHEAHAN: I don't disagree with that at
20 all. My point is more towards the Cloud-based
21 services that will be necessary for actually
22 managing the Smart grid and, you know, it's going to

1 be two ways. It's going to be distributed. There
2 are going to be micro grids. There's so many
3 disruptive technologies, which we talked about this
4 morning.

5 You know, Tom described this as sort
6 of a cyber physical network as opposed to what you
7 are talking about, and the real heart of the
8 question I think today is how do you think about
9 that cyber physical network, you know, that network
10 that collects data off of thousands or millions of
11 sensors and utility uses that data to run the
12 network more efficiently.

13 It's not just, you know, collecting
14 data that some companies sells for a profit. This
15 is more for to sort of the operation of the grid
16 that will be 10, 20, 30 years from now.

17 MR. SIEBEL: Mr. Chairman, if I could comment,
18 I'm going to get away from the customer engagement
19 subject entirely and dealing with the operation of
20 the smart grid which will require a software plan
21 where we have the sensors with repeaters, what have
22 you.

1 Now the economics are very clear. In
2 the last seven years, okay, we have spent about a
3 quarter-of-a-million dollars building a technology
4 platform that allows the utility to run these
5 systems, and this is what's necessary for them to
6 optimize both BAR, AMI operations, minimize
7 non-technical lawsuits, minimize technological
8 losses, real challenging problems, and the question
9 is all these issues always related to distributing
10 energy resource management.

11 This is a fascinating and difficult
12 problem, and you need a large and complex internet
13 foundation. We spent about a quarter-of-a-million
14 dollars, and in the next five years we will probably
15 invest another quarter to half-a-million dollars.

16 If the utility decides to build that
17 themselves, okay, and spend the number that's a
18 quarter of a million dollars or half a million
19 dollars building it themselves for some period of
20 time, they will get a guaranteed return on that
21 investment.

22 If instead of investing a

1 quarter-of-a-million or half-a-million themselves,
2 they license it for say a dollar a meter a year,
3 that is -- the problem is that historically that is
4 an OpEx for which they get no return and that is --
5 that is the way it has worked.

6 So I'm not certain -- and so I think
7 the question is I think that clearly the Illinois
8 Commerce Commission is taking a leading role in the
9 nation and is starting to wrestle with a very, very
10 important topic to make sure that we are incenting
11 the utility operators to do what's in the best
12 interest of the consumer.

13 So it's a very important issue. So
14 that's the math. Exelon and Ameren did it
15 themselves. In taking million of dollars, there
16 would be a return on their investment. Is that
17 really the best way for a utility to be utilized?

18 MR. SURBER: An example we have is even if we
19 looked at this place where we had spam earlier, so
20 you look at spam we get on a daily basis, it's
21 expounded expedientially and we used to build out a
22 system that would actually go over and track that

1 on-premise, so come into our data center and we
2 would kind of clean out the spam. It didn't always
3 happen, but that's an example of where we kept
4 scaling, and scaling, and scaling, and scaling and
5 effectively we were buying using capital dollars to
6 buy that infrastructure and stack it up in our data
7 center.

8 So if you look at it on a dollar
9 procurement, it is an exact match up with this.
10 Okay. We have this much money to clean spam and we
11 will do it for a couple of \$10,000 a year and that
12 is one of the specific clear compelling difference
13 in the cost. It's like if you pen (phonetic)
14 yourself, there are better solutions to do it
15 internally and say that's sort of the steel trap why
16 it's so vast, and I think right now there's a
17 problem with some people that are making -- the
18 market is coming is what I'm saying.

19 There's solutions out there every day
20 that are teetering on an edge, build versus buy,
21 build versus Cloud, where people are going through
22 that evaluation, but at some point I can already

1 fast forward in the future here. You can see five,
2 ten years from now that that balance or that scale
3 will be far away in favor of the coming
4 technologies, and the world is trying to play catch
5 up in that regard.

6 I think right now the only case where
7 people are making some of the decisions about that
8 Cloud versus build is where it's a very, very
9 compelling business case.

10 MR. TOLBERT: It's a very interesting dynamic.
11 When we think of utility regulation, we think of
12 least cost all the time. The energy efficiency
13 programs have to pass the cost-effectiveness test.

14 Are we going to build a wind plant, or
15 are we going to build a nuclear plant, or are we
16 going to build a gas plant? We look at the
17 economics of it, and this is one of those areas,
18 particularly as we make investments in our
19 transmission grid, after we make investments here,
20 we should be looking at it and we should be saying
21 what's the most cost-effective way for us to be
22 doing this and creating systems in which the utility

1 can make money off of those cost-effective ways to
2 do it versus being stuck in a model that is if you
3 build it you make the money off of it.

4 But really thinking about this as
5 what's the most cost-effective way, because that's
6 what's going to be best for the consumer, and what's
7 the best way for us to do this, I think that's the
8 question that we have to look at when we're thinking
9 about how we make investments to our transmission
10 grid.

11 In all honesty, as we look at the
12 numbers nationally nationwide, the amount of money
13 that needs to be invested into the transmission grid
14 over the next 20 years is astronomical, so this is
15 the time to be wrestling with this question and to
16 come up with an answer.

17 COMMISSIONER ROSALES. Excuse me. Can I respond?

18 I would like to thank the Chairman for his
19 leadership on this.

20 What I would like to say,
21 Commissioner, as we move forward, is to not
22 constrain ourselves, and the question would be in

1 what ways can we move forward?

2 I have some concerns when we have
3 regulatory constraints right away, which I
4 understand is a business -- which is part of the
5 business and we have to make sure that we're moving
6 in the right direction; however, I would like to see
7 us move forward.

8 With the amount of talent that we have
9 in this room today, hypothetically, we are going to
10 have the Cloud. We are going to use this. In what
11 ways can we use this, and not only that we look at
12 these costs over time, we start with the telephone.

13 You mentioned about how everybody has
14 them, but when we first started nobody wanted it.
15 It was too expensive to have. I'm not going to pay
16 that much for a minute, and now it's a fact of life.
17 This is going to be a fact of life 10, 15, 20 years
18 from now.

19 So in what ways can we utilize this
20 now, since we are talking about it, in this type of
21 age and not going back to the 20th Century and
22 moving forward? We know we are always going to have

1 restraints. There's always going to be a red light,
2 but for today there's a green light.

3 Let's talk about ways in which we can
4 move forward, because it's going to occur. There
5 are many people who don't want it, but there's a lot
6 of people that want land-lines, too, you know, and a
7 percentage who want the strings, and we move forward
8 in a different direction.

9 As a Commissioner, that's what I would
10 like to see. It's not a policy decision. It's just
11 kind of using hypotheticals, but that's the way it's
12 going to go.

13 COMMISSIONER McCABE: Can I add on that. To what
14 extent is the new FASB going to solve some of these
15 problems? You mentioned the FASB rules in the
16 process of being implemented to solve some of these
17 problems.

18 MR. SEIBEL: I wish I had that number, and I will
19 get you the FASB ruling. It's only two pages.
20 Okay. So I will get you your E-mail and get it to
21 you, but actually also it says that where we have
22 software service and these Cloud-based offerings,

1 okay, it says that where they acquired a licensing
2 agreement, where there's licensing, and where
3 they're subscription-based per day, per month, per
4 year, but where the customer has the right to take
5 possession of the software, and it's practical for
6 them to take possession of the software, that it is
7 going to be treated as CapEx and actually it's not
8 a -- there is no discretion there.

9 MR. SURBER: What he's saying is you have the
10 21st Century -- you buy the 21st Century model under
11 the auspices that you can run it in a 20th Century
12 fashion and, unfortunately, and I think that it's
13 absolutely true, that some of the cases the
14 companies aren't going to allow you to ever not
15 operate it inside the Cloud.

16 MR. SIEBEL: You could actually run in your own
17 internal Cloud. All you need there is a DM 30
18 layer.

19 MR. SURBER: I'm just saying where is the vendor
20 that offers that?

21 MR. SIEBEL: Where the vendor offers the ability
22 for the customer to take possession and it's

1 practical for them to do so, then it's treated as
2 CapEx.

3 MR. SURBER: Some Cloud applications will be very
4 limiting for some of their architecting. From the
5 standpoint for me to operate that internally would
6 be very, very difficult.

7 MS. BARTUCCI: It's a very empirical question.
8 It's like would it be really ever, and that's the
9 option of, yes, as long as you are willing to move
10 it into your own environments. We have to look very
11 hard at that question.

12 Are we ever really going to do
13 something like that? In fact, you would have to
14 have a crew to do something like that. I would be
15 reluctant to answer that question.

16 I want to go back and address one
17 question I think came up earlier. So we are really
18 talking about not so much technical experience, I
19 understand, but what is this going to look like
20 going forward, because it is changing, the utilities
21 of the future. I know we are calling it a lot of
22 different things and I think we have to be able to

1 plan and engage.

2 We talked about some things that we
3 thought we wouldn't see for another five or ten
4 years, but they're coming very adverse already in
5 micro grid. We never really thought that we were
6 going to be doing it except as a pilot. Now we have
7 got to do some things and we are already looking at
8 how we are going to implement the micro grid.

9 First of all, I think we are being
10 optimistic if we think we have 10 years on any of
11 this. So I think it's a matter of figuring out how
12 do we take -- how do we do in-house what we need to
13 do in-house and how do we do it outside the house,
14 what we need to do outside the house.

15 I think when we are talking the big
16 picture, it's a combination. It's not just one
17 solution, so it's better figuring out -- first you
18 have to find the solution, right, from a technology
19 perspective. It's not about taking expense or
20 capital. It's how do I solve the problem and then
21 how do I solve the problem most efficiently.

22 First you have to figure out what a

1 good solution looks like. It really is going to be
2 bringing a lot of different components together.
3 It's going to be a lot of different systems to get
4 integrated to run the grid in the future.

5 MR. SURBER: I don't think any of us are making
6 these decisions going in on a call basis. I think
7 to your point we are trying to figure out what the
8 right solution is, how do we figure out the
9 solution, how do are we using it a decade or less.

10 I think the hypothetical in my
11 mind -- I'm not an accountant -- but there is some
12 relief in the value of rules where, for example,
13 when you go to build or move and build the product
14 that all that project work at that point
15 understanding that maybe something that we could
16 capitalize. When we actually get into run the
17 model, when you are operating and pay the monthly
18 bill, that's going to be working
19 outside.

20 I think again what I would love to do
21 is to be in a situation that, you know, if this is
22 more prudent for us as a company to deploy capital

1 elsewhere, that's a better use of our capital for
2 the customer and, you know, say the software that's
3 more efficient to deliver as an expense, you know, I
4 would love to have the flexibility to choose that
5 without having to be making that conscious decision
6 of am I having to go impact the ratemaking process.

7 So I want to get some more real-time
8 recovery of IT costs, because it is on a different
9 pace, and say are the utilities traditional assets.
10 I don't know what that looks like.

11 I think there's some panelists today
12 that can address that better than I, but those are
13 some questions that I have. I think we just want to
14 have the ability to make a better choice for the
15 customer and not have any impediments to do that.

16 MS. DALE: I don't think, based on what I heard
17 here today, that it is going to be all one or the
18 other, all CapEx. There's going to be a combination
19 of capital investors that work in conjunction with
20 software. So I don't think it's totally a
21 disincentive for utilities to make the right
22 investment decision, because I think they're

1 probably going to be a little bit of both as we move
2 forward in these various technologies, a little bit
3 of CapEx and a little bit of OpEx

4 MS. PALIVOS: Thank you to our panelists for
5 their remarks. We will now break for lunch and
6 resume session at 1:30, if we could give our
7 wonderful panelists a round of applause.

8 (Applause.)

9 (Whereupon, a luncheon
10 break was taken.)

11 CHAIRMAN SHEAHAN: Welcome back. I'm
12 anticipating a very worthwhile discussion this
13 afternoon. To jump start this afternoon's dialogue,
14 we will begin with a conversation concerning the
15 regulatory and accounting treatment of Cloud
16 computing models.

17 At a time when the celebrating pace of
18 change in the utility industry means that it has
19 less room for error, that a number of destructive
20 forces that declining use of energy, storage, Micro
21 Grids, and distributed renewable generation, Cloud
22 software model offers an option that provides

1 DR. ROSE: Thank you. Thank you, Mr. Chairman.

2 The topic for Panel 3 picks up on what
3 we were hearing earlier this morning. How can we
4 make utilities indifferent to the cost
5 classification of traditional CapEx investments and
6 innovations OPTIX-like software, what policies need
7 to change. So that's what came up this morning.

8 So I hope we can dig into that a
9 little bit deeper than -- well, they introduced it,
10 and we're digging a little deeper and deeper still
11 in the next panel, the fourth panel.

12 So first off, let me introduce
13 everybody on the panel and, like the second panel,
14 we'll go kind of informally. I'll introduce
15 everybody now, and then we'll have the discussion.
16 We will go back and forth, and not all the panelists
17 will address every question.

18 First we have Matt O'Keefe of OPower,
19 who you heard from this morning, and then we'll hear
20 from Mariko Meier, who's Director of Regulatory
21 Studies at Enernoc.

22 Mariko manages Enernoc's demand

1 response business at the PJM region, and then we
2 have Lewis Binswanger of AGL, and Louie was named
3 Vice President of Regulatory Affairs for Nicor Gas
4 in August of 2013, and his role is responsible for
5 leading the company's regulatory activities before
6 the Illinois Commerce Commission.

7 The next panelist is Ross Hemphill, a
8 friend of mine. I should say Dr. Ross Hemphill.
9 He's Vice President of Regulatory Affairs and
10 Strategy for Commonwealth Edison based here in
11 Chicago, of course.

12 Next we have Molly Mulroy, Vice
13 President and Chief Information Officer of Wisconsin
14 Energy Corporation, and, finally, we have David
15 Kolata, I think he's well known to everybody here
16 because he's Acting Director to the Citizens Utility
17 Board.

18 We posed questions to everybody, and
19 the first question, which not everybody again will
20 address, but I think it's a good way to start off,
21 is what is the current regulatory treatment of
22 software and why does it present an impediment.

1 MR. BINSWANGER: I can go ahead and take the
2 first stab at that.

3 First of all, Chairman Sheahan, thank
4 you and the Commissioners for having us here,
5 especially to talk about this riveting topic right
6 after lunch.

7 (Laughter.)

8 But to answer your question, what is
9 the current regulatory treatment of Cloud computing,
10 when you look at internally-developed software, when
11 you talk about internally-developed software, the
12 software right now, when you go through the
13 requirement process and decide on a vendor, is an
14 expense today.

15 Once you have selected that area you go and
16 build it as a capital expenditure, and then when you
17 operate it, and train, and deploy, that's also an
18 expense, so you have that.

19 When you look at externally-purchased
20 software, say you are looking at entering into a
21 longer term contract with a license, currently that
22 endeavor would be a capital expenditure. So if we

1 go out and purchase any kind of license for a CIS
2 system, it's going to be capital. The new standard
3 though is called FASB Accounting Standard Update and
4 Subtopic 350S-40 for those who of you.

5 As counsel said earlier today, there
6 are certain tests that will go into effect next
7 year, and the two tests I think they were talking
8 about -- this is the new requirement -- is that
9 unless a Cloud Computing Arrangement includes
10 software, meaning both the following criteria, it
11 must be expensed.

12 So the first one is that we have the
13 contractual right to take possession of the code,
14 and this is the one portion that really wasn't
15 discussed earlier is that "without significant
16 penalty," and "without significant penalty" means
17 also that it's not going to add additional costs to
18 the utilities so that it's not just a matter of
19 saying, yes, you can go out and take custody of the
20 software or take ownership, it can cost us a lot
21 more to do that.

22 The second thing is that we can

1 feasibly run the software on our own hardware or
2 arrange to have it evenly posted elsewhere.

3 So those are the two test requirements
4 that have to take place after December 15th, so that
5 is what we are looking at today.

6 DR. HEMPHILL: That's a pretty good summary. You
7 are reading off my notes, right?

8 (Laughter.)

9 I, too, want to commend the Chairman
10 and the Commission for doing something that's very
11 difficult to do. Instead of focusing on the past,
12 you are looking into the future and trying to get at
13 it. There's a lot in particular in the electric
14 industry that's happening with the transmission
15 underway which you heard about, a lot of discussion
16 about the audit, Utilities Futures 2.0, but it is a
17 transformation.

18 A lot of new things that are going to
19 be happening part of it is, because of the Smart
20 Grid that's being deployed over the next few years
21 called the AMI that's going to be available, part of
22 it is because of the transformation of other assets

1 in generation, of distributed generation, and areas
2 like that, so there's going to be huge challenges
3 facing this industry and there's going to be
4 opportunities for customers as well.

5 So it is very good that you are
6 starting this process by getting ahead of the game
7 in terms of something like this, which I was amazed
8 this morning, coming in.

9 I'm an economist. I'm not an
10 accountant. I'm not an IT expert. I'm just a lowly
11 economist. I sat there and learned so much this
12 morning in terms of everything, innovation that can
13 come about regarding just this aspect in IT.

14 So, once again, what we need to do is
15 look to the future and see how can customers benefit
16 the most from this other transmission that's taking
17 place and this transformation in the IT space and as
18 it merges with the transformation that's taking
19 place in the electric industry. How can we get the
20 maximum benefit for customers as this takes place
21 and, as you asked, what can regulators to do to help
22 this?

1 You talked about impediments. I'm not
2 sure right now I can identify a true impediment
3 looking at how it behaves currently, but I can
4 certainly see that looking into the future there
5 could be some type of impediment that's created if
6 you continue with the same type of regulation that
7 you were using for the past industry, and we have a
8 new industry coming, moving forward, transforming,
9 as I said.

10 So I think back in my career in terms
11 of one of the first -- one of the earliest things
12 that I did in my career was talk about incentive
13 regulation. A great moderator, Dr. Rose, and I were
14 talking about different forms of incentive
15 regulations.

16 One of the things that people will say
17 very quickly is, well, all regulations are incentive
18 regulations, and that is true. All regulations is
19 incentive regulations, so you have to look at the
20 regulations that are in place, and how is it
21 practiced, and what type of incentives it doesn't
22 provide for the utilities, and are they the right

1 incentives.

2 So you are talking about accounting
3 rules in practice, and you have to see whether or
4 not looking forward do those rules actually affect
5 the decisions of the utilities that result in the
6 maximum benefit to the consumer, and in some cases I
7 think you might have to be a little more
8 introspective and say, hey, we have to put our minds
9 in the place of those that are in the utilities, and
10 what their fiduciary responsibilities are to the
11 shareholders, and how would we expect them to
12 function given the rules that are currently in
13 place.

14 So I know there's additional questions
15 that will dig deeper into this, but I thought I
16 would just start out with that.

17 DR. ROSE: Anybody else?

18 Just on that first question, is
19 anybody familiar with other jurisdictions as to what
20 they're doing? Is Illinois the first to really
21 address this?

22 MS. MULROY: May I speak a little to that. Thank

1 you again to the Commissioners for having all of us
2 up here today to talk about this.

3 In terms of jurisdictions, I do
4 think -- so we operate in four states, and I think,
5 you know, while the ICC has traditionally taken up
6 this topic, and it's certainly a pertinent area of
7 discussion, that we do have other states that have
8 more traditional standards and they haven't really
9 started this discussion.

10 From an IT perspective, typically we
11 don't hear what you are looking at. How do you
12 deploy common systems across various jurisdictions?
13 Obviously, there are cost impacts to our customers
14 related to that, and how do we get to a place where
15 we are utilizing and able to have one consistent
16 answer to that question.

17 Obviously, FASB is driving much of the
18 financial policy that we have, but what does that
19 actually look like in terms of the regulatory aspect
20 as well. We have not seen this in other states at
21 this point.

22 MS. MEIER: I am Mariko Meier. Thank you for the

1 opportunity.

2 I want to add a couple of quick
3 things. So when we look at jurisdictions across the
4 country and across the globe, I can certainly echo
5 what was said in the forefront of this conversation,
6 a lot of places that haven't been considering this
7 as an issue, but a few things that I will point out
8 is that this is something that has come up recently
9 in federal legislation, so the idea that PFCs could
10 be encouraged to look at this as something that's an
11 issue and to consider what incentive may be in place
12 today, because all regulation is basically incentive
13 regulation, and a big part of what's been discussed
14 at the federal level has been this FASB Standard
15 201505 and I wanted to clarify or build on what you
16 said earlier.

17 The way that the FASB language has
18 been clarified to a certain extent limits what we
19 can do for Cloud software, and that's why we are in
20 the position where the Commission can really take a
21 lead here, because what the FASB language did -- you
22 know, we talked a lot about how utilities can be

1 conservative and slow moving. Accountants are
2 really conservative and slow moving.

3 So when they clarified the language,
4 what they recently said was we're not really going
5 to change anything. We are just going to clarify
6 what's been in place before, and basically what they
7 said was when -- before Cloud software really
8 existed, and this is going to really sound basic to
9 everyone in the room who's an accountant or knows
10 anything about IT, because I know neither of those
11 things, but for the rest of you maybe they will
12 actually make accounting a little more sense -- so
13 what they said was software that used to exist, the
14 kind of software that the 20th Century software that
15 we have been talking about, if you build on
16 premises, that's going to be considered a capital
17 expenditure, always has been and will continue to be
18 considered that, because you are building something
19 up front and building a bunch of money upfront.

20 The idea was -- the reason why this
21 has been a confusing issue is because that has been
22 increasingly replaced with Cloud software and

1 typically with Cloud software you are not spending
2 that big chunk of money up front. You are spending
3 a little bit every month for subscriptions or there
4 is some other way to spend that money over a longer
5 period of time.

6 That's one of the reasons why it's
7 been adopted so quickly because the business is
8 really nice not having to spend all that money
9 today. To borrow much money to spend today, you can
10 spend it little by little over a series of years.

11 That's great as a business, but what
12 the ASU, FASB Standard really said was, well, unless
13 you can somehow make this Cloud software, which is
14 typically the ASU subscriptions, unless you can make
15 it something that you can put on a USB and actually
16 take possession of and as the person who might buy
17 it actually put it on your own machine, be willing
18 to put it on your machine, which basically
19 functionally means you are de-Clouding the Cloud
20 software, take it off the Cloud, put it on a stick,
21 put it on my machine behind my firewall, then you
22 can have the license, but if this Cloud software the

1 way we think of it today is kind of stuck being off,
2 and that was why -- that's something that was
3 brought up earlier, and I just wanted to say at a
4 national level that's something that's being
5 discussed.

6 Unfortunately, the clarification
7 didn't really clarify much. It just kind of said
8 let's stick to where things are, and that is why
9 this is such a great opportunity. We can talk about
10 it in a little bit more detail.

11 DR. ROSE: I think that kind of leads to the next
12 question on deployment. What will an optimal
13 relationship between the regulatory treatment of
14 different software compliant methodology, whether
15 on-site or in the Cloud, would look like in the
16 future? I think you just spoke to that a little
17 bit.

18 Anybody else care to address that?

19 MR. KOLATA: Yes. Thanks again for inviting us
20 today, Mr. Chairman and Commissioners.

21 At CUB we are very enthusiastic about
22 developments around software. That's why we are

1 working on data issues within the defense fund.

2 One of the main reasons why we have
3 been generally supportive of Smart Grids, at least
4 the value of Smart Grid is fully maximized, and we
5 have had an opportunity to meet GEO, OPower,
6 Microsoft, Google, IBM, the list can go on and on,
7 and there's a lot of exciting developments in the
8 space.

9 I think, regulatory speaking, as a
10 traditional black box, I haven't really focused on
11 that much. Utilities build proprietary systems, and
12 the big question is does it work, and we really
13 haven't done the kind of in-depth focus on how
14 things can be changed that we should do. So I do
15 think that this is an important topic and it needs
16 to be addressed.

17 I think that having been said, I don't
18 think that -- although the CapEx/CapEx distinctions
19 in accounting are important, I don't think it's the
20 biggest issue, because at the end of the day, I
21 think the biggest issue is optimizing the value of
22 the software to provide for consumers.

1 I think that sort of inevitably meets
2 you down the road of utility future questions,
3 because at the end of the day, it's what services
4 should the utility run itself as a monopoly but then
5 what services should that facilitate.

6 We don't want to have a situation
7 where you are picking a winner. What we want to do
8 is have an entrepreneurial platform that allows
9 recommendations, people to compete where it's good
10 for the entire industry, not just picking certain
11 companies -- nothing against any individual company.
12 It's just this is a new space and, you know, it is
13 sort of an entrepreneurial decision for a world that
14 isn't the most entrepreneurial traditionally.

15 So I think there's a lot of very
16 important issues here and I think they should be
17 looked at, but, at the end of the day, we definitely
18 want to make sure that we are creating a network
19 platform that allows for innovation that could
20 benefit consumers on multiple issues.

21 MR. BINSWANGER: I would like to add to that.
22 This optimal relationship between the regulatory

1 treatment of the future, one of the things that we
2 also have to contend with when we go out and make
3 large investments for something like a CIS system I
4 think it comes down to timing.

5 So if there's this optimal
6 relationship between the Cloud or not the Cloud and
7 regulatory treatment, it would be to allow the
8 utility to be able to address what happens if there
9 is a stranded asset there or not or how do we time
10 it appropriately to wind down an internal
11 development application and then move on to the
12 Cloud and address that more in real-time, because
13 right now if you have a capital investment and it's
14 in a statement to your rate base and then we switch
15 to Cloud computing, there could be an impact to the
16 utility.

17 So, again, it's about timing. We can
18 do that in light of the rate case or if you have
19 this optimal relationship that there could be some
20 type of acknowledgement from the Commission that
21 that's the direction we want to go.

22 In the long term, it will benefit the

1 end-use customer, then let's address it and see how
2 we can unwind it and go to the world.

3 MR. O'KEEFE: Great. Thanks again for having me
4 up here one more time today.

5 I do want to address the question
6 about picking winners, because I completely agree,
7 and right now when you look at the regulated utility
8 space, it looks to us as software companies who are
9 born in the Cloud that winners have been chosen and
10 actually are not the software companies in general,
11 given the really fast adoption of all these
12 equivalent histories, whether it's insurance, health
13 care, or banking, or life sciences, this shifts the
14 Cloud much faster. It seems that at this stage it's
15 not currently an even playing the field.

16 So when you think about the tensions
17 that need to be resolved moving forward, I see a
18 couple that come to the forefront.

19 One is this idea that thinking about
20 the outcome or the desire to purchase software.
21 Right now, as the example earlier from Mr. Seibel,
22 he presented around a customer service

1 representative for the software for them. Right now
2 there's a situation in which there are products that
3 produce the exact same result and one is in-house
4 and one is on the Cloud and there are currently
5 incentives for choosing one or the other even
6 providing this as a service.

7 A second is thinking about what the
8 new realities are for based operations and based
9 service for utilities. As you have invested in AMI,
10 as you have invested in a lot of technologies, there
11 are expectations that are different now for
12 customers in 2015 than there were in 2005. As one
13 example, although it's not necessarily replacing
14 currently in-house software, one thing that, for
15 instance, our company does is provide what we call
16 unusually restored.

17 What this means is that just like when
18 your flight is delayed or if you are going over your
19 data usage on your AT&T plan, you get an alert from
20 your utility that letting you know before your bill
21 comes out after the month that you are on track
22 towards the higher bill.

1 This is just a basic level of customer
2 service now for some folks who start to experience
3 this, so that may not have been in the past, but a
4 lot of consumers now expect that type of treatment
5 and that is only enabled by software.

6 A third tension is understanding where
7 we're willing to move outside the financial
8 accounting rules and advertising rules and admit
9 that there could be regulatory kind of rules that
10 always have been somewhat different and likely can
11 be, but understanding that tension and understanding
12 where we can drop a line is important to us all.

13 DR. HEMPHILL: The only thing that I have to add
14 is that the optimal relationship I think includes
15 the recognition that it's okay to try to achieve new
16 beneficial outcomes between the consumers and the
17 utilities.

18 So what that does is it allows -- I
19 think if that's a signal that's provided to the
20 utilities, it allows the utilities to pursue avenues
21 that lead to positive net welfare or the positive
22 net benefits of consumers, because they, too, will

1 achieve some positive utilities to achieve some
2 positive outcomes.

3 As a result of that, that gets back to
4 an earlier comment regarding incentive regulations.
5 It's a different type of incentive. It's more of a
6 symmetrical incentive-type regulation, and I think
7 that you need to pursue. It's not just -- again,
8 it's not just for the software. I think it's a lot
9 of different aspects that we are going to be dealing
10 with in the electric industry anyway in terms of
11 transmission.

12 It sounds like I've got the microphone
13 on. I want to jump on one thing. I want to mention
14 something that didn't get discussed fully this
15 morning, and that is there's been some discussion
16 about whether or not all customers are going to want
17 this. Are we talking about just a handful of
18 customers? Are they going to be looking for things
19 that the Cloud can provide?

20 So, like I said, I'm not an IT expert,
21 but I wanted to share with our IT expert who was on
22 the panel earlier and asked the question, and that

1 is how much of what we are talking about in terms of
2 how consumers can benefit going to the Cloud is from
3 individual consumer applications as a result of the
4 Smart Grid?

5 Some of these new things that we are
6 talking about, these services that will be provided
7 and available, because of the Smart Grid, how much
8 of the utility business as usual that's just going
9 to get more efficient, and I think that it was
10 alluded to, but I don't think it was fully discussed
11 this morning, and I'm just repeating what the IT
12 expert, and what she said is there's a lot, a lot of
13 benefit that can come just from the business as
14 usual by going to the Cloud and properly
15 incentivizing the utilities looking for those
16 opportunities.

17 MR. O'KEEFE: If I can just add one thing to that
18 that's such a critical point, although the examples
19 you heard earlier were companies that exist
20 specifically to have DSM output or customer
21 engagement output. The software service industry --
22 the Cloud industry is huge. It could be as simple

1 as replacing existing human resources software with
2 a new Cloud application where most of the issues
3 alluded to that, and maybe there's been decades away
4 as well.

5 We are providing examples because
6 we're engaged and excited to talk with the
7 Commissioners on energy decisions, but this is
8 throughout a utility outside of just the outbound
9 communications channels.

10 MS. MEIER: I am just going to add on that note I
11 completely agree that this idea of Cloud software
12 benefitting sort of a business-as-usual stuff, it is
13 certainly true.

14 What I also wanted to add, because I
15 have these same comments on my list, which is even
16 when you think about the software that we talked
17 about this morning and the fact that, yes, not every
18 customer is going to want to engage at the same
19 level, what ends up happening is that if the
20 customer that wants to engage, whatever percentage
21 you assume that is, engage and they either lower
22 their energy use or they engage with their utility,

1 so they're easier to reach out to, which lowers the
2 utility market cost, that doesn't just benefit the
3 engaged customers. It lowers the utility costs
4 overall which then benefits all customers regardless
5 of whether you personally choose to engage, because
6 if there are any benefits associated with the
7 software or if there are lower customer
8 communication costs associated with this software,
9 regardless of whether I choose to give the utility
10 my E-mail or I choose to download the app and change
11 my behavior, the utility is actually saving money
12 which does go into my rates.

13 So I just wanted to add that to the
14 list. It's not just the engaged customer that could
15 benefit from engagement.

16 MR. KOLATA: I just have a few more comments. I
17 do think that obviously Cloud Computing Software can
18 provide a lot of business as usual and it takes
19 coordination, and we should look at that.

20 I do think though the issue of
21 transition which is a very important one because it
22 has to be done carefully unless you create stranded

1 costs which can make the economy sort of just not
2 good for anyone.

3 I think it's a very important point to
4 consider, because what we don't want to do is get
5 into that situation again. In other words, if we
6 are going to take a hard look at the IT platforms or
7 utilities, we want to make sure that they're open,
8 that they're built professionally and encourage
9 innovation.

10 I think at the beginning a lot of it
11 will be more business-as-usual kind of product, not
12 everything, but I do think down the line you are
13 going to see a lot of very exciting software
14 developments, and I don't think that there would
15 be -- in most cases in my own view is that it's not
16 going to be something that consumers necessarily
17 have to think about all that much, but I've got a
18 lot of apps on my phone that I use, but I barely
19 know how they work, and they sort of take over. I
20 think that's more likely the analogy.

21 So I don't necessarily think I would
22 agree that the notion that most consumers are going

1 to care about the ins and outs is probably not true,
2 but that doesn't mean that people can't and won't
3 use it and benefit without necessarily knowing why
4 it's working.

5 DR. ROSE: That's a good point about how you term
6 it as obsolescent where you have to replace the old
7 technology with the new, but the new is advancing so
8 fast that it may be obsolete very soon.

9 And when you're talking about hardware
10 in particular maybe the Cloud or some of those
11 issues if you want to elucidate on that.

12 MR. O'KEEFE: Yes. So I thought I would. In
13 response to that, that's the ultimate purpose of
14 software to service Cloud-based technology in the
15 future group. Instead, we update our software every
16 three weeks, send out to everyone that's on our
17 system all of the details.

18 They are giving me constant subtle
19 changes so we do not have to wait five years to make
20 massive changes and then have one or two years of
21 deployment to that massive change. So nothing is
22 truly future proof but it is much closer to that

1 reality.

2 You are paying yearly licensing fees
3 because you are constantly behind the scene creating
4 small incremental updates that make sure that these
5 technologies are not only more user friendly but
6 react to the rest of the world, the consumer, and
7 utilities and businesses interacting with the
8 software.

9 So this is certainly not the same
10 case. In fact, we would have to have those kind of
11 conversations about stranded investments if they
12 were in the future.

13 DR. ROSE: It was stranded.

14 MR. O'KEEFE: I'm sorry.

15 MS. MEIER: I will build on that point, because I
16 think that there's a big benefit associated with
17 Cloud software in that it is updated constantly, and
18 there are two benefits. Well, there are lots of
19 benefits, but there are two benefits that I'll talk
20 about right now. One is exactly this obsolescence
21 issue that you are not paying a bunch of money up
22 front for an asset that you have to count on for 30

1 years. You are paying a subscription, right, and
2 certainly you have a contract usually for that
3 subscription.

4 You can't just decide after 30 days
5 that you not interested, but it's not going to be 30
6 years. You haven't put the money up front. That
7 certainly helps with that issue.

8 The other thing is that it's
9 constantly improving and that's something that you
10 don't really get with the traditional software that
11 sits inside your office, right, and frankly that's
12 something you wouldn't get if you put it on that USB
13 card so that you could, you know, comply with the
14 FASB standards, because then it would be in your
15 hardware and somebody would have to physically come
16 to fix it.

17 I'm sure all of us have worked at a
18 company when the blank system was updated
19 internally, right, and it's been like a two-year
20 process and everyone was talking about the blank
21 upgrades, and then it happens, and all of a sudden
22 the computer stops working and nothing was working

1 for three days and everybody was like, oh, it's the
2 blank update. Everything's broken.

3 That doesn't happen with Cloud
4 software, because it's all the time. And if you
5 think about the Cloud software that we are all
6 really familiar with, Facebook, that's Cloud
7 software, and Facebook changes stuff all the time,
8 but it doesn't break with the annual-based update
9 where all of a sudden the website is not working,
10 right.

11 Certainly there are updates people
12 hate. They dislike buttons, this, that, and the
13 other, but it's not really an issue of the software
14 has stopped working. It's always being updated, and
15 that's really the benefit of the Cloud.

16 MR. KOLATA: If I could just add a quick comment.
17 I agree completely with the statement that it is the
18 Cloud, but I think there's another issue, too, and
19 that's this does get kind of an easily-in-the-future
20 issue, because utilities are used to doing
21 everything, and vision I think we would want from a
22 consumer's point of view is a sort of open platform

1 for innovation whether utilities are facilitating
2 that, and certainly that raises a whole bunch of
3 questions that are important and that we are linked
4 with this idea.

5 We don't get that right at the same
6 time. My fear is that, in fact, if we do it, we
7 should do it all at once. Utilities are used to
8 doing everything.

9 I don't mean this to be super critical
10 of the IT space. Obviously, it has the capacity of
11 a business model to become a network and to dominate
12 and monopolize that network, and we don't want that
13 either from a consumer point of view.

14 We want an entrepreneurial platform
15 that really allows people to compete in those areas
16 where it's important for similar values in those
17 areas where utilities should provide this whole
18 service but make sure it's doing it in a
19 cost-effective way and they're not picking preferred
20 winners, but they're choosing the best option for
21 consumers.

22 DR. ROSE: Does anybody have anything else?

(No response.)

We talked a little bit about some of the issues on the third question, accounting regulatory treatment, so the question stands is can or should the Commission make accounting regulatory treatment for payments made under Cloud Computing Applications essentially the same as traditional in-house software purchase and development costs?

MR. BINSWANGER: Let me address that question, but before I go there, before I came here, I looked at our books, because I wanted to understand when we are talking about this IT infrastructure in the plant at Nicor Gas how much of it are we talking about when we are talking about range.

It is probably in the 2 percent range. It's not -- it's not a huge number. It's not a small number either, but it's one of those numbers that I think is manageable for us to be able to have some type of transmission strategy out of that into Cloud computing.

I think everyone agrees that at some point in time we are all moving in that direction.

1 To answer your question -- I forgot.

2 (Laughter.)

3 DR. ROSE: How regulatory treatment under
4 accounting is improved.

5 MR. BINSWANGER: So the answer is, yes, I think
6 the Commission should allow some treatment similar
7 to the way we do it right now and there has to be
8 this transition for us to be able to make this
9 investment into a Cloud Computing Environment,
10 because when we go into a Cloud Computing
11 Arrangement, it is for the long-term. It's not
12 going to be for a short-term endeavor.

13 It's just like when you make the
14 decision to go out for a CIS system, if we went into
15 and someone offered a great solution for CIS, it
16 would be in there for the long term, and we are
17 making that as a long-term decision, so we would
18 think that's one way to address it would be to
19 acknowledge that and somehow treat that similar to
20 the way we are currently creating it.

21 DR. HEMPHILL: Yes, Be direct in terms of
22 answering the question. The first part of the

1 question is can the Commission do this? I think
2 that's a legal question.

3 I've been advised that the Commission
4 can within their jurisdiction, but I'm sure that's
5 debatable. I think a more relevant question is if
6 they can, should they.

7 I do believe it is something that
8 should be given very strong consideration because of
9 the things that we said earlier in terms of
10 providing the right incentives, but any time you
11 make a major regulatory change like this, I think
12 you enter into it carefully considering the
13 advantages and disadvantages further, but I do
14 believe there's certainly a strong reason to
15 consider it.

16 MS. MULROY: I would echo the comments made thus
17 far. I think this is certainly an area that we
18 should continue to look at. I do think that if
19 there is an opportunity to implement other
20 jurisdictions to take a look at changes as well.

21 Certainly, as I stated before, from an
22 IT perspective, when I was looking at how do we

1 manage costs, the costs to all of our customers,
2 part of that is making investments, say an
3 application for infrastructure, that can be utilized
4 more broadly across all of our utility customers in
5 various states.

6 We have the consistency from a
7 regulatory perspective. Certainly that makes it
8 much easier as we continue to move forward to make
9 those selections and apply them more properly.

10 MR. KOLATA: I think for a lot of electric
11 utilities that are deploying AMI, I think that the
12 question needs to be looked at, because I came at
13 the sunset of the utilities, and we are going to
14 need to address and look at and fully maximize the
15 value of the Smart Grid.

16 So for gas utilities I think the
17 situation may be a little bit different and maybe
18 more of a case-by-case basis that will get very much
19 into questions of timing and stranded costs, so
20 these are the very same type of propositions, but
21 when you are deploying AMI, if you are going to
22 maximize the value of that and really look to the

1 spirit of what the statute says the kind of network
2 that we want, open decentralized competitive
3 entrepreneurial levels, then we are going to have to
4 address these types of questions, and we should.

5 MR. O'KEEFE: As I listened to the comments, I
6 was reminded, and it's important to know, there are
7 some similarities to the existing in-house software
8 requirements and the length of time and the length
9 of investment in them. They are longer and they can
10 be long. It's not that there is a long-term
11 relationship associated with going into one of these
12 contracts or subscriptions.

13 They seem to know that there is
14 customization, there's serious customization done
15 with each client when it's deployed. This is not --
16 you can just deploy the basic framework, but the
17 whole point is to have a platform on which you can
18 customize things for each utility and their specific
19 customer base. They all interact together and are
20 built on one platform, so alerting the northeast
21 will impact a major utility in the midwest, and vice
22 versa, but there is serious customization a lot of

1 time on each utility in partnership to make sure
2 these are the right solutions for that customer
3 base.

4 MS. MEIER: That's a fair point. I didn't mean
5 to imply earlier that the subscription meant that
6 next week you could switch your subscription from
7 one guy to another. There's certainly a lot that
8 goes into building those sorts of relationships and
9 making sure that everything works.

10 To answer this question specifically,
11 I think what will probably be coming up earlier
12 through the day is less about the specific question
13 should the Commission make improvements the same.
14 It's more about the fact that these are both
15 solutions of the same problem, but today they don't
16 play on the same level playing field, because you
17 can have a Cloud-based solution or a non-Cloud-based
18 solution to a problem. You can build that mainframe
19 in your building or you can have it in the Cloud.

20 I think a lot of what we are learning
21 today is that there are tons of benefits of having
22 the Cloud, and generally we are moving towards

1 Cloud-based software generally, but today they don't
2 play on the same playing fields because the
3 incentives are not the same, and so that's really
4 the issue.

5 It's not this is how mainframes
6 operate and specialize and, therefore, the same must
7 be applied to the Cloud. It's just that they have
8 to be treated in the same way such that they really
9 are competing on the same level playing field that
10 you have to actually have this world where a lot of
11 different vendors are competing, and it's in the
12 best interest of everybody to have that, but today
13 you don't have that same competition and that's
14 really what's driven that.

15 DR. ROSE: I think a couple of things that were
16 said that reminded me, too, that -- I thought Ross
17 came real close to saying it about this idea of
18 capitalizing versus expensing is an old issue even
19 though technology is new. Every time new technology
20 comes up, that same issue comes up.

21 So it's really a Philip Ryerson's idea
22 of capital verse expense in that.

1

22

(Laughter.)

You know, I guess what I'd like to bring out is is there something in particular here that could help the Commission and other jurisdictions to address what should be capitalized, and I think one of the Commissioner's questions earlier this morning goes along those lines to some kind of guidance on how it should be capitalized versus expenses, things to do with the Cloud.

What's different about this today, so you might look at it different than you would say other more traditional kinds of questions that come up when you are talking about capitalizing.

DR. HEMPHILL: Again, I hope you don't view this as sidestepping the question --

DR. ROSE: That's what I expected.

(Laughter.)

DR. HEMPHILL: -- what I want to avoid is just -- this is a very important issue, and there are a lot of very important issues in the electric industry that we are going to have to deal with in several years, but what I don't want to do is just

1 focus on this issue and forget about the big
2 picture.

3 I think what would help put this
4 Commission on the map in terms of a huge step
5 forward in terms of being innovative in your
6 approach to dealing with these issues that they have
7 to grabble will is to take the holistic approach and
8 try to figure out where do we need flexibility in
9 some of these rules. What is it that would be the
10 criteria for moving in a different direction?

11 I mentioned earlier I think, number
12 one on my mind is how the consumer makes sure that
13 there aren't reverse incentives in place that keep
14 the utility from actually doing things that in the
15 long run are going to positively affect consumers,
16 so I encourage more of a holistic approach as we
17 start to grabble with this.

18 DR. ROSE: That's fair. Maybe some of the IT
19 people would like to address it, and be as specific
20 as you can maybe provide some examples. Does
21 anybody want to take that on?

22 MS. MEIER: I don't particularly have an answer.

1 I guess what you are asking for is --

2 DR. ROSE: I'm trying to bring those two thoughts
3 together talking one side then another overlap
4 joining in this one, if there's some way. I can't.
5 I don't know much about the technology.

6 MS. MEIER: So I've been thinking about this
7 issue for several months now, and one thing that I
8 have learned is that I think about the world of
9 people that really understand Cloud computing and
10 the world that people really understand utility
11 ratemaking, the overlap is maybe zero or if there's
12 one I have yet to find them.

13 (Laughter.)

14 DR. ROSE: I think we just provided that.

15 MS. MEIER: Yes. So that's why meetings like
16 this are so important because I can tell you I have
17 been on the phone trying to track down somebody who
18 could help me better understand utility ratemaking
19 who know enough about what Cloud computing provides
20 to get to solutions and haven't found that person
21 yet, so I think that's a second goal coming out of
22 this kind of conversation.

1 DR. HEMPHILL: I would second that.

2 (Laughter.)

3 So I will tell you the story on
4 myself. I was sitting out there and I was listening
5 to the person from Microsoft this morning, and I
6 just recently bought a new computer and I wanted to
7 download all of the Office Products and I didn't
8 have a disk and there wasn't anything in the
9 computer to put a disk in, and they told me I had to
10 get on-line, and I expected to get on line and sit
11 there and wait for everything to download. It just
12 sort of happened, and I was trying to figure out how
13 does that take place.

14 (Laughter.)

15 So I'm sitting there listening to the
16 person from Microsoft, and I realized I'm getting it
17 from the Cloud, and it became more apparent to me
18 right there is one of the benefits that you are
19 talking about today. I understand now that I don't
20 have to have it fixed when any kind of glitches and
21 such.

22 I hope you don't mind that one aside.

1 MR. BINSWANGER: I might do the obvious thing and
2 turn the question around, but I guess why should
3 they be treated differently is the question that I'm
4 asking at this point.

5 Fundamentally, we are talking about a
6 lot of things. We are talking today about why they
7 are different might be reasons why you should not
8 allow data in the Cloud perhaps if that's the
9 concern or about the decision about the type of
10 products we want to choose as best, but I don't
11 think it's a fundamental question about whether
12 these are effective tools to meet the needs of the
13 utilities in the state.

14 So if we started that and thinking
15 about this idea of software for customer service
16 from Salesforce or from Oracle, why does that
17 fundamentally matter when we are thinking about this
18 question? I will come back to that, because I'm not
19 sure that we necessarily have the exact answer to
20 this and that diagram does not touch necessarily,
21 but I'm having a hard time truly getting
22 different -- except for the concerns around just in

1 general things in the Cloud, not the ratemaking part
2 of it.

3 CHAIRMAN SHEAHAN: Ken, can I jump in with a
4 question, and, you know, given that that diagram's
5 pretty thin, one discreet issue to sort of think
6 about is how do you account for depreciation for
7 Cloud-based asset.

8 If you buy a piece of equipment or
9 software, and that's pretty subtle, and there's a
10 period of time and it's obviously a big
11 consideration with ratemaking, How do you think
12 about that question in terms of Cloud computing?

13 MR. BINSWANGER: You know, I think that the way
14 we would look at it is the way we look at going on
15 contract or a license today. There is a license on
16 our books and we say what is the usable life of the
17 asset and then depreciate that over time.

18 But to your point, it's not an asset
19 that we have in-house, but the asset is the license
20 itself, so we would treat it the same way as we
21 treat other IT systems, depreciated over that same
22 life.

1 DR. ROSE: Anybody want to say anything else? Do
2 you have any other questions?

3 COMMISSIONER ROSALES: I do. Mariko spoke about
4 the fact as well that it is constantly changing and
5 upgrading, so you buy the specific amount of time.
6 That's how you would depreciate it?

7 MR. BINSWANGER: Yes, exactly. So you would
8 enter into an agreement and say this would be a
9 five-year license that you have and this happens
10 today. I mean, we go out and purchase an asset and
11 we pay maintenance fees on an annual basis and there
12 are upgrades that occur throughout that time frame.
13 We still have that asset. We still depreciate the
14 asset, so we do it the same way.

15 DR. ROSE: Any other questions?

16 CHAIRMAN SHEAHAN: What's the typical length of a
17 contract in the Cloud world?

18 MR. O'KEEFE: I can speak to our company. It
19 varies. It depends upon the type of work you are
20 doing.

21 I think that the range of
22 three-to-five years is reasonable to state. Some

1 are on the lower end and some are three-to-five
2 years is ballpark. That said, our product is
3 especially trend deployed and it was cap deployed on
4 the top with the DSM outputs which are on cycles and
5 various prescriptive lengths of investment periods.

6 When you talk about them as more of a
7 customer care oriented product, we are seeing longer
8 contracts for those products.

9 CHAIRMAN SHEAHAN: How do you think about
10 depreciation of an asset that's continually being
11 improved with small updates?

12 MR. BINSWANGER: I think that's a trick question.

13 (Laughter.)

14 I think I would tie it to the length
15 of the license, you know, that's because even though
16 it's continually improved, as our assets are today
17 that we own, they're continually upgraded, you know.
18 I would look at it the same way.

19 I mean, what is the length of that
20 license agreement, that is the life of that asset,
21 until you re-up it. To me, that's the life of it.

22 DR. HEMPHILL: I understand the question because

1 we oftentimes in our mind tie it to physical
2 wear-and-tear type concept, and in this case it's
3 not a physical wear and tear, and the beauty of
4 these agreements is that the asset continues its
5 value. You can actually get more value as they
6 continue to make upgrades to it, fix glitches, or
7 whatever.

8 So what is diminishing over time is
9 the time that you have to use it, and therein I
10 think will be the justification for depreciating an
11 overlap of the agreement itself.

12 MS. MULROY: I think there are also continual
13 upgrades that are made that are improvements.
14 They're more incremental in nature versus major
15 upgrades. Even today, you will have, you know, sort
16 of 2.1, 2, 3, I mean, so these are about fixes.
17 These are smaller, again, sort of incremental
18 achievements that are being made.

19 I think you really have to have those
20 major upgrades where now we are adding significant
21 functionality or new aspects of the customer
22 interaction which does have implications today in

1 terms of whether it's in-house or Cloud.

2 I think there's some logic there that
3 could be leveraged as we continue to look at product
4 options as well. Those don't typically happen as
5 frequently, just because they then require much more
6 rigorous testing.

7 Obviously, you want to make sure that
8 whatever it is that you are deploying isn't
9 breaking, so there's a lot more investment that goes
10 into those large upgrades as well.

11 DR. ROSE: What is the life? You said the life
12 of the assets. That's kind of indeterminate.

13 I have a Microsoft subscription to
14 Adobe Acrobat where that's 12-years old. It just
15 keeps -- I keep re-upping it, and so that's a
16 completely different software from what I bought
17 originally.

18 Of course, I use riders all the time,
19 so there's -- and unless there are new upgrades and
20 they hit me up for another hundred dollars or
21 whatever it is, but all of the other times, it's
22 just updating itself on my computer.

1 So is that the same kind of thing? If
2 that's true, then what is the life?

3 MR. BINSWANGER: Well, I mean, you have used an
4 operating system or some version of it at some point
5 in time. They say we are no longer going to
6 maintain that version. Sorry. You can keep running
7 it, if you want to, but we are not going to maintain
8 it if anything happens. I mean, it could be cut
9 off. I'm still looking at what is the term of your
10 agreement, your lease in terms of if they changed
11 versions versus if they no longer support them.

12 MS. MEIER: I think in the Adobe example, I don't
13 know how often they make you pay. Maybe once a
14 year?

15 DR. ROSE: Several years.

16 MS. MEIER: So probably your license when you buy
17 you have to pay --

18 DR. ROSE: The Reader is free.

19 MS. MEIER: Right. Right. Let's say you pay a
20 hundred dollars. That gives you the right for five
21 years, and then it will include all the upgrades for
22 that five years, and then once the five years is up,

1 they say, hey, again, in order to get any upgrades
2 you can have the full version you have or you are
3 going to keep it or you need to re-up your contract.

4 I think that's what Louie was talking
5 about when he said the life of the contract, maybe
6 the life of your contract with Adobe will be five
7 years and then when you have to pay again to
8 restart, you are basically buying the asset again.

9 DR. ROSE: There's some risk for utilities. You
10 get -- you become kind of associated with one type
11 of Cloud Computing Application, it's going to be
12 difficult to switch to somebody else after that time
13 period is up, so you are not bound but somewhat
14 obligated to keep re-upping for a new software base.
15 You are obligated to keep using that software, the
16 one you initially picked.

17 MS. MULROY: Because it's a type of business
18 processes, so you basically are integrating those
19 business processes, in the way of the business, so,
20 technically speaking, your ability to change
21 technology is actually very simple. It's all in the
22 business process that goes along with that, that

1 major investment, and, obviously, you haven't
2 changed management. That can be significant
3 depending on the type of application that you are
4 using.

5 CHAIRMAN SHEAHAN: Would that be different for a
6 Cloud-based system as opposed to an on-premise? I
7 mean, how would that transition compare? I think
8 that was the question Ken was getting.

9 MS. MULROY: You know, I don't really think
10 there's necessarily a big difference between Cloud
11 and the more traditional.

12 Again, what you are talking about is
13 more a component of change with the people. You are
14 talking about the business, so it's going to be the
15 prior investment no matter what, sort of how you
16 manage the back end and what that looks like, which
17 is what we are talking about here really doesn't
18 matter all that much.

19 DR. HEMPHILL: First of all, I want Ken to quit
20 asking these technical questions.

21 (Laughter.)

22 All I can tell you is the group of

1 people here from ComEd that are with us know more
2 than I can give you anecdotally. It would be a good
3 question to ask the previous panel, but my
4 experience has been if we have a major piece of
5 software that you built and are running and
6 maintaining, and then we find out that we need to do
7 a new version of it, or need to bring in a different
8 one, or build a different one, I have been told that
9 there's a point where you stop making changes. You
10 can't do anything with it for a period of time until
11 we get this new thing right.

12 My guess is that with the
13 Cloud if let's say you change from one provider to
14 another, that doesn't stop the Cloud that you are
15 using. It continues to be updated as such, but I'm
16 trying to find some way --

17 (Laughter.)

18 COMMISSIONER ROSALES: I would like to expand on
19 that, if I could. Earlier when I asked about
20 expanding horizons and speaking of hypotheticals,
21 Mariko, you mentioned you didn't foresee that you
22 could change over from one Cloud to another. Expand

1 a little bit about that. Why?

2 MS. MEIER: Sure. Sure. So I was just
3 clarifying a point that I made earlier. So I think
4 earlier I accidentally implied that you could get a
5 monthly subscription, in November you could pay one
6 company and do it, then in December you could say,
7 okay, I was just kidding. I want to switch my
8 subscription to another company.

9 Typically that doesn't necessarily
10 happen with software like that, because it does
11 require a certain amount of customization and that
12 is a fairly large solution that's being customized
13 for, in this case, a utility customer.

14 So all I was saying was certainly it's
15 easier to switch, and despite being the IT person on
16 this panel, I would not really consider myself an IT
17 person. I'm sure my colleagues in the back are
18 rolling their eyes at me as an IT expert, but I
19 think if you have a non-cloud-based solution, it is
20 much harder to switch, because you have built
21 something on-premise. You are maintaining it with
22 people that's usually performing for you and it is

1 really a big investment that you have made
2 on-premise with your people, your time, your staff;
3 whereas, if it's a Cloud-Computing Arrangement, it's
4 simply that. It's an arrangement.

5 So I would say, what's a good example?
6 You know, switching lawyers. You would have an
7 arrangement with your attorney. Switching lawyers
8 isn't necessarily the easiest thing to do, because
9 you have an ongoing history with that attorney. You
10 know, he or she may know about your previous
11 whatever that you have been doing, good or bad, and
12 you kind of want to keep that relationship going,
13 but there's nothing contractually or nothing put on
14 that doesn't let you switch attorneys every month,
15 you could, but you wouldn't really do that. From a
16 practical matter, you wouldn't really be switching
17 your Cloud-computing arrangement that frequently.

18 DR. ROSE: When does the custom become
19 proprietary?

20 MS. MEIER: What?

21 DR. ROSE: When does the custom become
22 proprietary?

1 MR. O'KEEFE: What I'll say to that is the
2 customizations already exist within the software
3 developed when you make live or when you decide to
4 not make live. The key to them are for
5 customizations are done for utilities. I don't have
6 to answer to that, although I don't think that's
7 typically an issue that we have dealt with, but we
8 can get back to that one.

9 I do want to say though I'm going to
10 go with the lawyer analogy that the most
11 time-consuming portion of these changes or any
12 start-up of a cloud integration solution is the data
13 integration, just like the most time-consuming part
14 about seeing a lawyer is giving them the update on
15 what you did in the past, the data integration.
16 It's not the deep, technical, you know, software
17 development inside -- the in-house software
18 development or in-house solution being integrated to
19 data so that spigot can be turned off and turned
20 back on with the provider, but a key come be
21 typically because the training, et cetera, you have
22 a little bit of a let down.

1 MR. BINSWANGER: You know, I would match that.
2 Not switching isn't necessarily bad. Okay. I mean,
3 from a utility experience, if we have invested a lot
4 of money in a system and it's working fine and
5 getting the bills out accurately and on time, and if
6 we just maintain it longer than we have had the
7 Cloud, it doesn't necessarily mean it's good or bad.
8 It's just it's an option.

9 MR. KOLATA: Just to add, I would agree with that
10 completely. I would say that's true for the utility
11 business. That's clearly business as usual on how
12 it functions.

13 I think that's probably not the case
14 for consumers facing applications in the future.
15 In that case we want to make sure that we're
16 creating an environment where OPower and C3 Energy
17 will not always compete for customers, and unless
18 there's important data, but there really is a
19 distinction between sort of a monopolistic function
20 a utility has and then things that are more
21 competitive, and drawing that line is something that
22 we can create and raises a lot of interesting

1 questions.

2 COMMISSIONER MAYE: Getting back to the
3 ratemaking issues, obviously, I think we have talked
4 about the fact that there isn't that regulatory
5 incentive for utilities to pursue a
6 Cloud-based product.

7 So what other incentives should the
8 utility -- should we put before the Utilities to
9 explore that option?

10 It seems as though that is where the
11 great expense to the consumers are. So without that
12 regulatory incentive, what other incentives need to
13 be in to allow us to pursue that route?

14 DR. ROSE: I think that's for the next panel.

15 COMMISSIONER MAYE: Oh.

16 (Laughter.)

17 DR. ROSE: There's Carl back there. He's waiving
18 his hand.

19 MR. O'KEEFE: I think that every software company
20 is thrilled by competition, and I think that having
21 a level playing field is a starting point, and
22 that's what we are asking for. We want to be able

1 to compete with the folks on the other side. I will
2 try to give a better word than non-Cloud-based like
3 dirt-based or something like that. I don't know,
4 but we will come up with something. There we go.

5 All this talk about the Cloud has made
6 a few laughs after awhile, but it's about an equal
7 playing field and, you know, we are companies that
8 are excited to get down and dirty and create the
9 best products for our customers, and so that
10 equivalency is what's important.

11 MR. KOLATA: I would agree with that and agree
12 with what Ross said earlier about the holistic
13 approach. I think we are on top of that.

14 I think that certainly there are
15 issues around accounting, but I think you could
16 solve those issues tomorrow, and, hypothetically,
17 you still wouldn't necessarily have a situation
18 where utilities would be doing everything in their
19 power to maximize the benefits of consumer software.
20 That's because it goes into broader issues that also
21 need to be addressed, and so I think that is an
22 important issue but it's part of the overall

1 package.

2 DR. HEMPHILL: It's a very good question and I
3 think that's why we have to pause and think about
4 it.

5 COMMISSIONER MAYE: I thought it was.

6 (Laughter.)

7 DR. HEMPHILL: It's a very good question. That's
8 why it takes a long time to answer.

9 When I say holistic, I think what we
10 have to do is look at how the traditional
11 regulations have worked, and one of the unfortunate
12 things about traditional regulations it has always
13 been if you are looking at 20/20 hindsight at the
14 decisions that are made by utilities and whether or
15 not they were more prudent and utilities are already
16 stuck, that's a difficult game to play for the
17 industry that is by nature less diverse.

18 So what you need to do is take a look
19 at things that you like the utility -- how do you
20 like the utility to behave, things that you like the
21 utility to pursue with the mind set that they're
22 doing it because they think it's going to be to the

1 maximum benefit of the consumers, but try to take
2 away the fear of the ramifications if maybe not all
3 of the things that they pursue are successful.

4 So there's not only the positive
5 incentive that we provided but also maybe
6 eliminating some of the punitive measures that have
7 gone along with some of the traditional regulations
8 that we don't mind saying.

9 COMMISSIONER MAYE: Not at all. Thank you.

10 DR. ROSE: The Chairman brought up something that
11 it seems that we categorize that needs a standard
12 for how the regulatory ratemaking treatment, without
13 answering the question, can we properly characterize
14 what the arrangement is, then that will help inform
15 how you are going to treat the regulatory part.

16 That's my take away from all of this,
17 just talking about --

18 MS. MULROY: I think we have been talking about
19 it a lot today, and it's just the other implications
20 of other regulatory agencies setting important rules
21 around the financials and how do you enter the
22 evolution of services really in the business

1 environment.

2 Obviously, at the federal level, FERC
3 has rules that obviously have implications across,
4 but given that these -- you know, this was a
5 decision that came from an advisory that came out in
6 April, is there some way to tie the regulation so
7 that as those decisions or those policies are being
8 issued that I'm hoping that we'll be able to take
9 and deal with them as they become available?

10 Obviously, going through a rulemaking
11 takes time and takes some effort. If there's
12 some way to integrate that, I think that also would
13 be helpful.

14 DR. ROSE: Well, there's one more question and
15 might be a real short one, and I think we can
16 turn over the questions, so these are yes or no, or
17 no comments.

18 Should the Commission conduct the
19 rulemaking to provide guidance and certainty to
20 utilities in regard to CCA payments --
21 re-arrangement payments? Anyone want to take that
22 one?

1 DR. HEMPHILL: Do I really have to say yes or no?

2 DR. ROSE: You have no comment, then none.

3 MS. MEIER: Can we ask a clarifying question?

4 DR. ROSE: There was a legal issue raised earlier
5 about whether or not there is something that can be
6 addressed, and maybe an attorney would be best to
7 address whether or not the Commission can.

8 COMMISSIONER ROSALES: Let's not call it
9 Cloud-based. Let's call it cumulous-based.

10 (Laughter.)

11 DR. ROSE: Let's take it in a general way. Does
12 some kind of rulemaking procedure make sense?

13 DR. HEMPHILL: But I worry about rulemaking
14 sometimes that go on for a long time.

15 DR. ROSE: Nothing's perfect.

16 DR. HEMPHILL: I think rulemaking would be my
17 suggestion and find a way to get everything out in
18 the open and a decision quickly, maybe some type of
19 stakeholder involvement at the beginning and then
20 quick rulemaking would be my suggestion.

21 MR. BINSWANGER: I would ask that if the benefit
22 of rulemaking, without saying yes or no -- I'm just

1 saying rulemaking -- it would give the utilities a
2 full understanding before it makes some of those
3 decisions, because one of the most difficult things
4 for a utility to do is go out and make certain
5 business decisions that we believe is in the best
6 interest of our ratepayers and of our business and
7 that we get overruled or disallowed, you know, a
8 year later, two years later, then we have to take a
9 hit.

10 So, again, if we had it clearly
11 written out in a rule to say this is how you would
12 treat it, this is how we would accept it, once you
13 make it final, it would make it a lot better on the
14 students to clarify the question.

15 MS. MEIER: I guess the clarifying question that
16 I was kind of joking about is whether rulemaking is
17 the only way to go, and I think you implied that
18 there is a legal question on what would have
19 happened, but I think there's a question on speed,
20 and I think that's the big question is, as was
21 discussed this morning, the industry is a little
22 behind where the rest of the country and the world

1 is on Cloud software.

2 So I don't know what the most
3 expedient and thorough process would be. If there's
4 a rulemaking, then, of course, we would support
5 that, but I ask back to the Commission and the
6 lawyers in the room what the options are and whether
7 they have all been considered as far as the
8 tradeoffs between speed and thoroughness.

9 MR. O'KEEFE: As a result, I would really
10 appreciate the opportunity to take this conversation
11 and this inquiry and come up with something official
12 that cannot only influence the way the utilities in
13 this state operate but also recognize the leadership
14 of this Commission on this issue already just that
15 we are having today.

16 As we pointed out several times, in
17 order to us I think to answer this question I think
18 we should think about the quickest and best way to
19 also influence other jurisdictions having yet the
20 time to do this.

21 There's nothing I think any of us
22 would love more than forwarding on a piece of

1 information to many of our colleagues across the
2 country who work on these issues.

3 MR. KOLATA: I think there should be a holistic
4 process that examines these issues, that puts the
5 consumer in the center maximizing, that raises
6 almost a whole host of other questions, and the key
7 thing that I really am intrigued by, but also
8 worried about, is how do we make sure that we get
9 the benefits of an open platform and open network
10 where really the utilities facilitate rather than
11 doing, because I think the utilities traditionally
12 and will always do doesn't raise the same type of
13 issues I think are around things that can better be
14 served by an entrepreneurial framework.

15 MS. MULROY: I would just echo what everyone has
16 said to-date and have some additional considerations
17 about what that looks like from a policy perspective
18 and what those opportunities look like potentially
19 for other issues in response.

20 COMMISSIONER del VALLE: I want to make what
21 David just said about rulemaking at this point as an
22 important issue in isolation or do we take a

1 holistic approach?

2 Everyone has been talking about the
3 consumer, the customer, the customer, the customer.
4 We still haven't really convinced the customer that
5 there are benefits. Most customers still don't know
6 what the benefits are as we talk about data and the
7 integration of data, and there are issues that
8 customers raise, those that are somewhat
9 knowledgeable about data privacy, security, cyber
10 security, you know, they read about Target and they
11 read about fingerprints, your fingerprints now being
12 out there.

13 Now there's all kinds of things that
14 need to be addressed, and so do we take this issue
15 and make it part of our discussion about utilities
16 of the future? How will customers benefit from
17 distributed generation? How can we deal with all
18 the issues that are out there in a holistic manner
19 and convince people, the customers, because
20 basically what you are talking about here is how are
21 you going to get paid for this and how are you going
22 to make money off of this?

1 Isn't that the bottom line, how do you
2 make money off of the investment?

3 COMMISSIONER MAYE: And then recovery.

4 COMMISSIONER del VALLE: How do you make money
5 off of the investment, a fair return, right, off of
6 the investment, and so that begs the broader
7 question regarding how will customers benefit from
8 the changes, the rapid transformation that is
9 inevitable that is taking place? That's the big
10 question.

11 So I would be reluctant to deal with
12 this important issue as well as other issues in
13 isolation rather than through a holistic approach in
14 a bigger discussion.

15 COMMISSIONER MAYE: So I just want to answer
16 that. I think when I hear a holistic approach I
17 think of -- and our Chairman always tell me that I'm
18 impatient, which I am -- I think of a process that
19 doesn't end, a process -- a conversation which upon
20 conversation, upon conversation.

21 I think when I started at the
22 Commission a little over two years ago, we were

1 talking about the future of the utilities. Guess
2 where we are today? We are still talking about the
3 future of utilities. Nothing has really -- you
4 know, there's been kind of nothing put into place,
5 no steps have been taken, firm steps have been
6 taken. Everybody is still around the nation talking
7 about the future of the utilities in Chicago.

8 We talked essentially about how --
9 what the benefit is in an expeditious process and
10 why there's a benefit, and I agree,
11 Commissioner del Valle, that there are a lot of
12 consumers still unaware of this, even more so, like
13 time is of the essence.

14 So taking the holistic approach is
15 like we are kicking the ball down an endless road.
16 That's my concern about that.

17 COMMISSIONER del VALLE: One of the reasons why
18 we haven't gotten to the holistic approach is
19 because there hasn't been the leadership on the part
20 of the Commission, and I think that with the current
21 Chairman, current membership, I think it is
22 possible, as Commissioner McCabe has shown and

1 demonstrated by convening folks -- you have been
2 part of those discussions -- that there is I think a
3 movement, unlike in the past, and I agree that in
4 the past there's been no movement.

5 CHAIRMAN SHEAHAN: David, I wonder if you
6 could -- you sort of alluded to this question a
7 couple of times. I wonder if you could help, you
8 know, draw a clear line between Cloud computing and
9 sort of issues within that discussion on utilities
10 in the future. How do you think about that as a
11 consumer advocate?

12 MR. KOLATA: Well, I think that the issue is the
13 same whether it's a Cloud solution or it's sort of
14 an in-house proprietary dirt solution.

15 DR. ROSE: Ground.

16 MR. KOLATA: Ground, yes. Ground.

17 (Laughter.)

18 I think the issue is the same which is
19 that how can we make sure that all these
20 advancements in software can work to the consumers'
21 ultimate benefit, and I happen to believe that a lot
22 more exciting innovations on Cloud systems, and I

1 think that can provide some of the advances. I'm
2 leaning in that direction; however, you have to look
3 at the individual situation and circumstances.

4 So I don't know my way around the
5 utility future issues. I would necessarily say,
6 well, there's apparently a difference between Cloud
7 and old school, but I do think that these types of
8 questions eventually lead to those utilities of
9 future questions.

10 I will say, Commissioner Maye, I agree
11 that, you know, these are important issues that we
12 are building. It's not necessarily either/or, and I
13 think we can start with some aspects of it, and some
14 of these questions are very, very difficult,
15 especially when you start getting into potentially
16 unbundling or a little bit of the distribution
17 system, and figuring out the New York Rev process
18 and start to consider there may be some ways that
19 have traditionally been a pure utility monopoly
20 function and the great advantages of an
21 entrepreneurial framework achieves that, but those
22 are things that we need to address.

1 The basic question now if utilities
2 aren't doing something, whether there's third
3 parties, how are utilities facilitating it? Well,
4 how are those services priced compared to the risks
5 and reward? All these things are important
6 questions that utilities need to look at.

7 DR. HEMPHILL: Having said the word "holistic," I
8 want to make an attempt to explain what I meant, and
9 that was not to start some seemingly endless effort
10 to wrap our arms around everything. As utilities,
11 we can't wrap our arms around everything. We don't
12 do everything. That's not what I intended.

13 By holistic, what I meant is that you
14 start the process instead of using a consistent
15 policy, and one aspect of the policy is that you are
16 looking at the incentives along the way on different
17 aspects of the change in industry, and then address
18 them consistently.

19 In this case you can start out taking
20 a look at this particular issuance and say how
21 consistent are they and is there something that we
22 can do to correct those incentives in order to

1 properly incentivize utilities to do things that are
2 going to maximize benefits for customers.

3 DR. ROSE: Are there any other questions of the
4 Commissioners?

5 (No response.)

6 We will take any questions from the
7 audience that anybody has. Yes, sir.

8 MR. KELTER: Can I make a comment?

9 DR. ROSE: Sure --

10 MR. KELTER: Rob Kelter from Environmental Law
11 and Policy.

12 DR. ROSE: -- as long as you don't take more than
13 seven minutes.

14 (Laughter.)

15 MR. KELTER: I think I can do it in less than
16 seven minutes.

17 You know, I think we do need to keep
18 in mind that there are tools to get the utilities to
19 do innovative new things without giving them
20 incentives, that they do have an obligation to serve
21 and, as we look to the future, we have to figure out
22 the right balance. It shouldn't just be about all

1 giving them incentives to do new things.

2 DR. ROSS: That will be addressed in the next
3 panel whether or not additional incentives.

4 Again, unless there's another
5 question, I'm not seeing any, let's join me in
6 thanking the panel.

7 (Applause.)

8 We will break until 3:15.

9 (Whereupon, a break was
10 taken.)

11 CHAIRMAN SHEAHAN: All right. I would like to
12 ask everyone to take their seats. This is an
13 incredibly resilient group. All the seats are still
14 filled.

15 This is our last panel. It will focus
16 on defining the challenge of promoting deployment of
17 new information processing technology and to the
18 discuss realistic options the Commission can analyze
19 for potential implementation. Incentives should
20 focus on the benefits of customers and to the broad
21 utility environment in general.

22 As the moderator of our last panel, I

1 would like to introduce Dr. Carl Peterson. Carl
2 teaches economics and statistics at the University
3 of Illinois, Springfield, where he's affiliated with
4 the Center for Business and Regulation. Carl's also
5 an academic affiliate with NERA Economic Consulting
6 specializing in energy and public utility
7 regulations. Carl has held senior positions within
8 the Commerce Commission.

9 I first got to know Carl about 15
10 years ago when we were both assistants for
11 Commissioner Hart. So I'm pleased that he's here
12 with us, if you would help me welcome Carl back to
13 the Commission.

14 (Applause.)

15 DR. PETERSON: Thank you, Mr. Chairman, and I
16 appreciate the Commission staying all day and
17 waiting for this last panel. I know there's a lot
18 of conversation we have had today and we are going
19 to have some detailed conversation here in the next
20 90 minutes as well.

21 The format for the last panel is going
22 to be a little bit different than we saw in Panel 3,

1 though we will be continuing this discussion
2 concerning the incentive structures and, more
3 particularly, the other incentive structures -- and
4 I use that term - the "other" because I have no
5 other word to use, the other incentive structures
6 that might be available.

7 So what I'm going to do is I'm going
8 to put the first question to the panel and then
9 we'll just go through and we'll give each panelist
10 about five or so minutes to give their two cents,
11 maybe five cents. We might be able to get a nickel
12 out of it.

13 Also, since this is the last panel of
14 the day, we would like to maybe give you a chance to
15 comment on the day's approach, and what you got out
16 of it, and perhaps what you want to leave the
17 Commission with at this point.

18 I will also invite the Commissioners
19 to interject questions at any time. I think it's
20 easier to do that than try to wait till the end and
21 make you lose the context of the question. If you
22 have questions, please interject.

1 CHAIRMAN SHEAHAN: I have got a few new panelists
2 we can introduce.

3 DR. PETERSON: I am going to -- having said that,
4 that's the format that we are going to use.

5 I also want to -- before we get to
6 that -- introduce the new panelists that we have.
7 I'll point out that Matt, Jake and Mariko have been
8 introduced before, so we know them.

9 Our next panelist is Ed Abbo. Ed is
10 the President and Chief Technical Officer at
11 C3 Energy. Welcome, Ed.

12 Craig Nelson is next to Ed, and Craig
13 is the Senior Vice President of Regulatory Affairs
14 and Financial Services for Ameren Illinois.

15 Welcome, Craig.

16 MR. NELSON: Thank you.

17 DR. PETERSON: Next to Craig is Jim Jenkins. Jim
18 is the Vice President of Regulatory and Public
19 Policy for American Water, and I am told that
20 American Water is the largest investor-owned water
21 utility -- waterways water utility.

22 MR. JENKINS: We are still on top.

1 DR. PETERSON: I'm not sure why I was told that
2 but I was told that. Welcome, Jim.

3 And last, but certainly not least, is
4 Susan Satter. Susan works as a public utility
5 counsel at the Illinois Attorney General's Office in
6 the Public Utility Bureau.

7 Welcome, Sue.

8 Okay. With that, we heard a lot of
9 discussion in Panel 3 concerning the ratemaking
10 approach to try to deal with these new information
11 processing technologies, and so what I'm going to do
12 now is set up a question for the panel and I'll turn
13 it over to Matt first and we'll just go right
14 through the panel.

15 MR. O'KEEFE: Should I punt, given I have been
16 talking all day long first.

17 DR. PETERSON: I'll leave that up to you. If you
18 want to punt, we'll do that, but what we want to
19 address is what other approaches, what are those
20 specific targeted approaches to creating incentive
21 structures, and when we talk about incentive
22 structures, I want you to think about that in a

1 broad sense, not just incentive structures in the
2 sense that we are trying to pay the utilities to do
3 X, Y and Z, but the broad sense of incentives that
4 can be modified, whether those are targeted
5 incentives or a broader sense of incentives perhaps
6 performance-based regulation, or metrics-based
7 regulations or other constructs, you know, perhaps
8 those are programs that the Commission could
9 implement to try and create new incentives or better
10 incentives for the adoption of these new
11 technologies.

12 Who wants to take the first shot at
13 that?

14 MR. OSTER: I can start if you want. Lucky me.

15 So incentives in -- I also want to go
16 to disincentives and talk a little bit about
17 blockers and what can prevent return of blockers on
18 software solutions.

19 So I can sit here and talk about
20 blocker software and belabor that topic all day
21 long. I won't do that. Everybody understands what
22 makes a software specialist. I want to talk about

1 the two issues that are worth the Commission's
2 consideration.

3 The first thing is you have to go
4 forward with rulemaking and continue this
5 discussion. I think the topic that will come up
6 time and time again is security, so your concern
7 about security and data protection aside, and we
8 think about that a lot in EnergySaavy, and I think
9 it was brought up before, and you mentioned before,
10 that is the minimum bar for acceptance in this
11 industry, that you have strong security protocols
12 and that we need to test the utilities, all of our
13 companies, but I want to think about additional
14 issues.

15 Tom mentioned before that, you know,
16 finance and health care are two industries that live
17 in the Cloud. So I want to go a little deeper I
18 think. What does that mean? So first all banking
19 information is back and forth on the Cloud. I look
20 a little bit into health care. You think about
21 health care in the Cloud, when you are at your
22 doctor's office these days, you walk in. Doctor

1 meets with you. They're all carrying a tablet of
2 information. All that health information is in the
3 Cloud of your personal information.

4 If you compare the health care
5 information versus the amount of kilowatt-hours used
6 in a house, do you think the information you have is
7 more vulnerable than your average customer?

8 I'm not saying that data processes of energy isn't
9 important, but think about the entries that happen
10 in the Cloud.

11 When you look at prescription
12 services, you have doctors transmit their
13 prescriptions. Almost all of that is in the Cloud.
14 Look at DataPath. Surstrip is one of the biggest
15 companies. They process more than one billion
16 prescriptions over the Cloud. That's prescription
17 drug information.

18 So when you think about security and
19 people start worrying about security, put it into
20 perspective, the other industries that have moved
21 into the Cloud and what that has meant to the Cloud.

22 With on-site solutions, we talked a

1 little about this, but on-site solutions they grow
2 old with age, patches and outdated security systems.

3 Before I joined EnergySavvy, I worked
4 in the government. As a reward for my service, my
5 data was hacked. I was probably looking at the
6 expiration date. I had this service and all kinds
7 of paperwork that monitored all my information,
8 E-mail once a week, tells me whether or not there's
9 something I should look at, something I shouldn't
10 look at, computer password which I couldn't figure
11 it out, called it in and figure it out takes a lot
12 of time. It's a pain, and I have to deal with it.

13 OPM's Security breach was a result of
14 an outdated software system that's on-site. OPM was
15 30-years old. It fall out of date and they couldn't
16 even bring the software system up to date with a
17 current third party. They couldn't do data
18 inscription. They couldn't do multiple on-line
19 applications. They couldn't bring the software
20 system up to date because the system was so old.

21 That is the type of thing we are
22 talking about when we talk about private and data

1 protection issues. We have to consider comparisons,
2 so what happens if we lose control of our data
3 ourselves, there's ramifications on both sides.
4 On-site just because we live behind the firewall
5 doesn't make it more secure.

6 I also think of the OPM protection
7 handbook on technology information. That was all it
8 took to break into all that information. So as you
9 go into this thing, that would be one blocker you
10 hear time and time again is security, so I want to
11 put that out there as consideration. On-site
12 doesn't mean better protection.

13 The other thing I'll say in that space
14 we count on utilities to deliver electricity and
15 natural gas, of course, and they're good at that and
16 I want them to do that. I don't want Amazon to
17 deliver my electric, but I do want Amazon to take
18 care of my web services.

19 We use Amazon's web services all over
20 the place and they are professionals at security
21 systems, and I am not, and utilities aren't, and so
22 we should have utilities to do what they're good at,

1 but let's ask the Cloud software expert to do what
2 they're good at it. They understand software. They
3 live and breathe software security systems. They
4 have security experts.

5 So if you are tracking security,
6 remember the drug industry is doing that. On-site
7 is no more safe and, you know, let the experts do
8 what they're good at, so they are good on security.

9 The other topic I want to raise while
10 I'm on this issue, I think the Commission should
11 consider is think about the cost of value for
12 private software systems, and before you to start
13 looking at utility procurement of Cloud-based
14 software, there's multiply models of software that's
15 out there today. There are also multiple models of
16 software services.

17 We talked a lot about Salesforce
18 today. Three of the four slides showed Salesforce.
19 Salesforce is a horizontal software company. They
20 built products that would work for whole industries.
21 It's customized for different security issues and in
22 their company, like ours, they are more integrated

1 and they're built to serve the utility industry and
2 the energy industry, and so their purpose is they
3 are built to draw software solutions for the utility
4 industry.

5 When you take a horizontal service,
6 you have to customize it. The cost of value is
7 longer and the customization is cheaper and contract
8 hours longer and the result is software that's
9 on-premise.

10 When you take a vertically-integrated
11 solution, you take a company which is nothing but a
12 supply industry and you build a better solution, you
13 get cost out of rate base.

14 The Commission is considering
15 overseeing procurement of software solution as
16 capital expense, that's another thing to consider.

17 So those are two issues, security,
18 cost of value raised in the Commission today,
19 incentives, other things to consider, that's what
20 you got, and I'll leave it at that for now.

21 DR. PETERSON: Thanks.

22 Who wants to take another stab at

1 this?

2 MS. MEIER: All right. Okay. Hi, again.

3 So what I thought might be useful is
4 to walk through a little bit of kind of what I've
5 heard today and to provide a little bit more
6 commentary on those other things exactly, and then I
7 don't think that it's really -- even really
8 necessary to think about what the benefits of Cloud
9 software are over non-Cloud software.

10 The fact of the matter is both of
11 these kinds of software solve the same problem and,
12 you know, I think many of us in this room will say
13 that Cloud software is probably better, but the fact
14 of the matter is both software solutions do certain
15 problems, and the way that the status quo is set up,
16 one is considered a capital expense that can get
17 rate-based and one is considered an operating
18 expense and that cannot, and that makes the playing
19 field not level and to consider that pretty
20 arbitrary, right, that this is where you are storing
21 your data, whether you are storing it on-premise in
22 your building or storing it at Amazon's web services

1 location one mile or a hundred miles from here, it's
2 going to impact how it's treated from a regulatory
3 perspective. It's going to impact your ability to
4 earn. It's truly arbitrary.

5 I mean, I was talking about kind of
6 like the situation you can renovate your green
7 chairs but not your red chairs. It doesn't make a
8 lot of sense. So we are -- I don't even think it
9 really -- you don't really need to think that Cloud
10 software is better to want to solve this problem.
11 You just have to realize that both Cloud and old
12 school solutions should be competing on the same
13 playing field. I think that's really what today is
14 all about.

15 We appreciate the opportunity to be
16 here and in particular bring together the minds that
17 know about Cloud software and the minds that know
18 about ratemaking and maybe find one person who will
19 know about both walking out of here. So maybe I
20 should re-assess what ratemaking. That sounds like
21 a fun game plan.

22 So, on that note, I think the question

1 that was brought up earlier was what are the
2 solutions, what are the solutions that are out
3 there, and one of the answers that I can give you
4 there aren't any, because we are ahead of the curve,
5 and that's great that we are starting that
6 conversation in a broader way before other
7 commissions and we're really able to bring these
8 kinds of issues up, and that's really exciting.

9 There are broad solutions that are
10 being discussed, so the two that are on the top of
11 mine, and probably for most people in this room, is
12 New York Rev, that was brought up a lot, and then
13 the UK way of looking at it, the Reo. You heard
14 that term is another way that people are thinking
15 about this.

16 I'm not -- one I'm not going to talk
17 about in a lot of details because I don't have much
18 time, but also because I don't know enough to talk
19 about it for too long, but New York Rev is doing
20 that holistic approach that we talked about on that
21 earlier panel.

22 While I am extremely excited about

1 what New York is doing, part of the reason why I
2 brought up this concern or this question between
3 being holistic as thorough as possible and time,
4 because New York Rev is going to be a long run, and
5 it would be cool on the other side I think, but
6 that's not really the most expeditious solution
7 necessarily.

8 Somebody asked about other
9 jurisdictions, so I will just quickly talk about the
10 UK. The UK system the way -- what they're trying to
11 do is to make their utilities indifferent between
12 capital expenditure and operating expense, because
13 what they're seeing is that this differentiation
14 between what is CapEx and what is OpEx is starting
15 to get messy, because of the software, because of a
16 lot of things that are changing.

17 So, you know, 20, 30 years ago it was
18 pretty clear what capital expenditure was and what
19 OpEx is. It was pretty clear, but now not only
20 software but across the board you are seeing these
21 lines get messy, and if you talk to an accountant,
22 they'll tell you the FASB accounting board is really

1 spending a lot of time saying, well, this one's
2 capital, this one's not, and, well, this particular
3 situation will do this and it's getting really
4 complicated.

5 In the UK system, they're saying it
6 shouldn't matter. It's not about whether something
7 is considered CapEx or OpEx based on accounting
8 rules. What we need to do is put incentives in
9 place to best benefit the end user, and this
10 decision between CapEx and OpEx doesn't really
11 matter.

12 Both of those are huge undertakings.
13 There are huge differences from the status quo, and
14 I'm certainly not necessarily suggesting that we do
15 something that broad-based, but there was a question
16 brought up earlier on how other regions are thinking
17 about it, and I just wanted to make sure those two
18 were brought up as well, so I will stop there and
19 answer any questions.

20 MS. SATTER: Well, I would like to respond.

21 DR. PETERSON: Sure.

22 MS. SATTER: Thank you. So the question is what

1 are the incentives to do the right thing, and so how
2 do we define the right thing. That's the big
3 question, I think the fundamental question.

4 I am going to assume, for purposes of
5 this discussion, that Cloud solutions are less
6 expensive, more reliable, and more secure than the
7 current software that is on the premises. I'm going
8 to assume all of those attributes.

9 So when we look around, we say in the
10 financial industry, in the health care industry,
11 Cloud computing has been adopted under the existing
12 accounting rules; in other words, when the software
13 and IT work becomes an expense, no longer requires
14 capital investment, it is treated as an expense.

15 So my question then is what happens to
16 your capital budget when you are using fewer dollars
17 for IT and you are not using those capital dollars
18 for IT.

19 Now let me go back. What is the right
20 thing? For a utility, particularly like electric
21 utilities, and gas utilities, and infrastructure
22 utilities, the right thing is to invest in the

1 infrastructure, invest in the pipes in the ground,
2 invest in the distribution automation, invest in
3 meters, if that's what the General Assembly directed
4 you to do.

5 So what I'm hearing is that we have
6 this opportunity to shift dollars from an IT
7 possibly sinkhole to hardware in the ground
8 infrastructure that will make our system more
9 reliable, more resilient, more long-term. It's an
10 opportunity. It's an investment under the current
11 accounting rules, because what organization does not
12 want to preserve and use its presumably somewhat
13 limited capital budget for core activities, for core
14 competencies.

15 So let's say a utility recognizes,
16 yes, if I go to Cloud computing, it will be a
17 smaller expense. It will be a smaller cost to the
18 public than our current situation. That's good for
19 the public, but we also are freeing up money to
20 invest in our core work, so now we have got -- we
21 have replaced poles. We have replaced circuits that
22 need to be replaced. We have done work on

1 substations, because we are not spending the money
2 on things that don't really require a lump sum
3 investment.

4 So why is something classified or
5 treated as an expense is being treated as a capital
6 expense? Okay. So an expense is an ongoing
7 expenditure compared to an investment or capital
8 expense, which is a big lump sum.

9 How do you recover that big lump sum?
10 Usually over the life of the asset. Well, we have
11 been told that the lives of these Cloud assets are
12 different. They're just fundamentally different,
13 and that's what makes them attractive. That's what
14 makes them least cost, and that's what makes them
15 something that you think you want to do, that ends
16 with an actual profit, that allows you to free up
17 money for its core function would want to do.

18 Accounting follows reality. And if
19 the reality is that there's no lump sum investment,
20 then accounting should follow that and not try to
21 create a lump sum capital investment when one wasn't
22 made, then you get questions, like the Chairman

1 raised, well, how do you treat the depreciation?
2 What's the life? What's the appropriate return on
3 something that's going to be changing all the time?
4 Do we want to encourage things like flexibility?
5 You know, this year maybe something got a new Cloud
6 function. There's all kinds of things that really
7 characterize this expense at this cost as an
8 expense.

9 Why are we here today? I think
10 there's a very good reason. The Cloud computing
11 function appears, from everything we have heard, to
12 be unique to the IT process over time. It's
13 something new. It's what we are doing in the future
14 with all this distribution adopted. It makes sense.

15 Utilities should seriously consider it
16 on the basis of prudence. Utilities make prudent
17 investments; in other words, their investments and
18 their expenses, if you will, should be least cost.
19 They should be most effective, and if it turns out
20 that Cloud computing makes the most sense, and we
21 are having this discussion, so that that's kind of
22 setting the context for utility investment, maybe we

1 have^ we've missed the ball, because now utilities
2 are thinking, you know, there is an area that we are
3 learning about, and this is a direction that we will
4 go on simply prudence and for the benefit we will
5 reduce our cost to the public. We will increase our
6 capital expenditures, our capital budget for our
7 core competencies.

8 So I suggest that trying to fit Cloud
9 computing as an expense into the capital investment
10 box is counterproductive, and, in fact, treating it
11 as an expense provides an incentive to utilities to
12 spend on its core competencies, and that's what we
13 want to do, and that would be the goal that I would
14 suggest that we pursue.

15 DR. PETERSON: Craig.

16 MR. NELSON: Thank you.

17 I just want to address what Susan said
18 and I agree in part and disagree in part, and I want
19 to amplify I agree in part and disagree in part.

20 Let me first address the policy
21 direction. I think we already have a good policy
22 direction. I think back to the legislation that we

1 had just a few years ago, the Smart law, the
2 Infrastructure Modernization Act. We have already
3 got the direction from the policymakers in the state
4 that we have Smart Grid and we are going to
5 modernization. We already know the direction that
6 we have.

7 Everyone in the room thinks that we
8 should be examining Cloud computing and going that
9 way which makes sense when it makes good business
10 sense and good sense for our customers.

11 So -- and, Mr. Chairman,
12 Commissioners, I think we can take a step in the
13 right direction without solving the whole ball of
14 wax. I think we can take step by step moving in
15 that direction and I suggest specifically a way of
16 getting there within my five minutes I hope.

17 Well, I think this can be a win win
18 for customers and utilities. Clearly there's
19 benefits for customers. If their Cloud approach is
20 the least cost approach, that's wonderful, but if it
21 offers services to customers beyond what they have,
22 that's wonderful. Those are wins for them, plus I

1 think what we were proposing in capitalizing some of
2 these products and expenditures is a benefit for the
3 customers as well.

4 And I'm talking about not everything,
5 Susan, just the up-front costs, and so instead of
6 expensing the up-front costs all in one year and the
7 formula rates charging our customers all in one
8 year, I then agree we should capitalize them, as the
9 others have said, and amortize them, and
10 depreciating them over the life of the contract that
11 we are talking about.

12 So what do I mean by up-front costs?
13 I want to be specific. This is past the last end, I
14 mean, the connection costs, this new software, so
15 new systems that are coming, the customization
16 costs, the loading the data, playing with the data
17 and testing the data, all very significant costs up
18 front.

19 In fact, you know, when you are
20 analyzing what the costs of the contract, the Cloud
21 computing contract should go with the term, let's
22 say, five years, you can even pay for the expected

1 updates up front and see if you take a significant
2 amount of the cost of that contract and paid more of
3 it up front, and then we reduce the month by month
4 and still capitalize a good portion of it.

5 FASB got it wrong. I'm an accountant
6 by training, CPA long ago, but their fix is not a
7 fix. There's no way we are going to be able to take
8 this big data thing that's out there and put it on
9 our servers and run it. There's no way that Cloud
10 computing companies are going to let us run it
11 ourselves either. That's a joke. So it's not a
12 fix. I'm suggesting a compromise where up-front
13 costs are capitalized in monthly ongoing costs or
14 expenses.

15 And, specifically, I think that the
16 up-front costs should be intangible assets. There's
17 a category, and I'm talking about intangible assets,
18 and they automatically go into plant and equipment
19 and become part of rate base, the up front, too, I'm
20 talking about.

21 And, Commissioners, I think you have
22 various options. We talked about rulemaking, and

1 that would be my top choice. I think that buying a
2 time limits makes sense, but instead option two
3 would be possibly a workshop, followed by a short
4 proceeding, followed by an order in the direction of
5 this on a long-term perspective trying to solve the
6 utility of the future. It looks at stakeholders to
7 draft legislation.

8 I think the other two are better,
9 because they are short, simple steps to solve this
10 particular problem, and utilities, as they're
11 looking for options for software, should do the
12 right thing, and we are.

13 I think -- Tom, I think we got eight
14 or 10 Cloud contracts already that we have moved
15 forward and we are looking toward to a significant
16 one, and so even without this incentive, we are
17 going to do the right thing, but from a business
18 perspective and from a policy perspective, it just
19 makes sense to incentivize people to do the right
20 thing.

21 So I think these up-front costs make
22 sense from an accounting standpoint, regulatory

1 standpoint, and from an incentive standpoint, to
2 move us in the right direction toward the Cloud when
3 it makes sense. That's about it for right now.

4 DR. PETERSON: Ed.

5 MR. ABBO: If I could comment on this, maybe just
6 take a step back as to why is the Cloud really
7 needed here, and we talked still about the same
8 functionality being available through on-premise
9 software and Cloud software.

10 If you really take a step back and
11 look at this a little bit more holistically or
12 strategically, the benefits of the values associated
13 with grid modernization were basically putting Smart
14 meters in place, sensors on the distribution of
15 transmission generation equipment.

16 The value comes from actually
17 analyzing those data more broadly than we currently
18 were looking at the Smart meter data in conjunction
19 with the transformer substation data, transmission,
20 syncphasors, generation equipment, trading systems,
21 et cetera. That's where the actual value comes
22 from.

1 And given the industry, Mr. Siebel
2 talked a little bit about it, the volumes of data
3 that need to be actually ingested, correlated,
4 analyzed, the only cost-effective way to do this is
5 actually to have computing Cloud structures. These
6 are computing structures that essentially scale up
7 and down and cost efficiently if you are using them
8 or not, and they deliver the value as the grid
9 modernization grows.

10 And so the question is, you know, what
11 is the value? And what we did, and Mr. Seibel
12 alluded to, is we have actually worked very closely
13 with the Kensing (phonetic) Company on average the
14 order of 2 to \$300 per meter per year, for customer
15 meter per year, and the value to the consumer, as
16 well as to the utility, in running a more efficient
17 operation in essentially reducing line losses,
18 unbilled energy all across the entire business
19 process of the utility that can be derived from this
20 modernization that really needs Cloud computing to
21 make it happen.

22 So I think that's another kind of

1 angle on why are we here, why are we talking about
2 Cloud computing. It's really an enabler to unlock
3 the value as an investment that we are all making.

4 And, you know, similar to some of my
5 colleagues' comments on, you know, why is Europe
6 able to move more quickly, we talked about the UK
7 system and the Reo system which has to do with
8 allowing the distribution of the utilities,
9 essentially innovate and invest in innovation unlike
10 the value of grid modernization.

11 Mr. Seibel talked about Enel's Global
12 operations there where they're essentially deploying
13 ways to manage the reliability using Cloud computing
14 and software. They're moving very aggressively to
15 the Cloud and doing so in programs that basically
16 are 18 months to 36-month programs.

17 The reason that they're doing that is
18 because they have incentives in place that actually
19 deliver business value for their customers to
20 deliver values in their operation and they gain from
21 that.

22 So it's kind of a performance

1 incentive to actually move and move quickly, and I
2 think the best -- you know, again, the reason we are
3 here, and I applaud the Commission for bringing us
4 all here to discuss this topic.

5 DR. PETERSON: Thank you.

6 Jim.

7 MR. JENKINS: First of all, I really appreciate
8 the opportunity to be up here and to discuss Cloud
9 computing. Often water is part of this low
10 technology-type utility sector. It's actually not
11 the case. I mean, we are looking at Cloud
12 computing. We actually have Cloud computing
13 deployed. We deploy it right now in the areas that
14 are outside what we call our "crown jewels." That's
15 what we call internally is our crown jewels, whether
16 it's our customer information system, billing system
17 or our accounting system and our asset management
18 system. That does not mean that we are not looking
19 at it in terms of security and pulling capital
20 efficiently.

21 We actually got it deployed in things
22 like our account management. We have got it

1 deployed in self-service. Any time we do any type
2 of training, collaboration, we are on the Cloud with
3 that, and we are even looking at from the source to
4 actually out of the distribution source, all the
5 type of monitoring devices in terms of source water.
6 Source water is to our sewer plants.

7 We are also looking at distribution
8 with utilities, and we have got examples of that.
9 We operate in 16 states and we got examples of that
10 in various states.

11 I would say that I thought Craig
12 addressed, you know, the subject and, likewise, with
13 Sue, is really important. I think you raised some
14 really good points. It's that we want to do the
15 right thing. We need to do the right thing for the
16 customers.

17 What Craig outlined, these up-front
18 costs, as I was sitting here listening, it really
19 get into things that we tackle as an industry across
20 this Commission for many years, as well as others,
21 is energy generation.

22 If your current costs do benefit

1 customers through multiple periods, then up-front
2 costs -- it doesn't make sense to try to load it all
3 in expense. That's where the accounting got it
4 wrong. The accounting is dealing with open
5 market-based businesses, not really focused on
6 regulated businesses like we have, so I think that's
7 one of the things that we can do and certainly the
8 Commission has authority to do that.

9 In terms of our company, I even went
10 back and started asking questions that immediately
11 popped up to us in terms of real integration across
12 up front that you have got to go through with that,
13 and then -- I don't want to lose my time -- there's
14 other innovations that are out there and around the
15 country the electric industry that we looked at, and
16 those go to capital and they go to both expense.

17 So if it's in the public interest and
18 you are able to do that to actually bring benefits
19 to the customers, those are some tools that we have
20 in the tool box to look at as well.

21 MR. O'KEEFE: Great. I'm glad I crossed out
22 about 15 things I was going to say. First, I think

1 it's really important to underscore some things
2 Craig said that the value of the Cloud is not worth
3 talking about fundamentally today.

4 As utilities across the state and
5 across the country are deploying a lot of solutions
6 that exist in the Cloud, and that operate
7 Cloud-based software solutions that already exist,
8 the question today is fundamentally about why is
9 there this disparity about how solutions are
10 treated.

11 I think we heard a lot of interesting
12 perspectives on that, and I think that the way that
13 our company set up our payment agreements should not
14 necessarily be a fundamental question. It's an
15 important thing to consider, but the outcome, and
16 the purpose of the contracts, and what the product
17 is being provided, should be more important, and
18 let's find the alignment there first between
19 existing solutions and those that are Cloud-based.

20 To go back to the question about other
21 jurisdictions what they're doing, the UK is really a
22 good example. New York Rev is looking into that as

1 well, but one of the things that I did want to note
2 is that just another thing that some states are
3 doing is they are allowing you to generate revenues
4 from specific types of CapEx subject to jurisdiction
5 such as United Management Program that are using
6 software as a service. That's one example, but it's
7 hard around an office where we have dozens of
8 employees that think about this thing all the time
9 and working in 35 jurisdictions. We didn't come up
10 with examples of that.

11 DR. PETERSON: Thank you, Matt.

12 Any questions from the Commissioners?

13 (No response.)

14 Any questions from the panel?

15 (No response.)

16 Does anyone want to ask someone else a
17 question or comment on what's been said?

18 MR. OSTER: I just want to make additional
19 comments to the extent a little bit on what you said
20 and what Matt said.

21 We talked about utilities and future
22 growth up here a couple of times. I sort of make

1 the leap between Cloud software utilities in the
2 future and shared learning, and I'm not going into
3 the accounting part here. I'm steering clear of
4 that.

5 When we install on-site software at a
6 utility, you know, changes are made, patches are
7 made, improvements are made, customizations done,
8 and all of those learnings and all of those best
9 practices are made on that software, but they can't
10 stay on that software and they live with the
11 utility.

12 With companies like us, who do a
13 Cloud-based software system, Matt talked before
14 about doing three week-improvements, my point being,
15 I mean, it could be six months of improvements being
16 made across different jurisdictions. There are 35
17 jurisdictions. They're not that many. You have got
18 us beat there, but what we have learned in New York
19 as a result of working with utilities in the Rev, we
20 bring to Illinois, the only way the industry is able
21 to move forward for utilities of the future is if we
22 do it as a shared experience across the industry.

1 If utilities in New York are moving toward Rev, we
2 need to take the best practices out of the software
3 system and bring into Illinois.

4 If you continue to rely on on-site
5 solutions, you lose a lot of those best practices
6 and shared knowledge, and utilities have to make the
7 choice individually.

8 I'm not saying every single system
9 needs to live in the Cloud. Utilities need to make
10 those decisions based on what works best and what
11 doesn't, but if we don't move toward Cloud-based
12 systems, we lose our knowledge of shared experience
13 we are going to need as utilities of the future.
14 That's what I wanted to address.

15 DR. PETERSON: Craig.

16 MR. NELSON: I thought of something else. I
17 think I'm amplifying what either Ross or Louie said,
18 and it's the risk adverse nature of a utility and so
19 on. And if the Commission does want us to move in
20 the Cloud computing direction, I can't understate
21 the importance of bringing that policy guidance
22 enlightening and getting utilities to clarity

1 certainly and I'm feeling better about moving in
2 that direction in a big way.

3 So if there's clarity -- if there's
4 clarity, the best direction we should be heading,
5 and there's clarity how we handle the accounting
6 ratemaking purpose, it makes our conversations with
7 our board, senior execs a lot better as we move
8 expenditures in that direction.

9 CHAIRMAN SHEAHAN: Craig, you may have answered
10 this question, but I was trying to think about
11 Susan's point, and I think her point essentially is,
12 and correct me if I get this wrong, if this is such
13 a great idea, why aren't you doing it on your own
14 and why don't you then just use the savings to
15 invest in something you could get a return?

16 In the private sector in, you know, a
17 start-up context, a hundred percent of the
18 businesses are using Cloud. The rate of adoption is
19 growing exponentially and the utility space is very
20 low, so there's a real disconnect, and I'm kind of
21 curious as to what, you know, your responses are.

22 I mean, why is there that disparity if

1 the equation is as simple as, you know, if this is
2 such a great idea, why aren't you doing it already?
3 Why aren't you doing it?

4 MR. NELSON: And we are. And just a couple of
5 examples, unrelated to AMI, all that customer data
6 software that we have acquired, that's called
7 Clarity Software, the customer access their data so
8 they can use the Cloud approach to access their data
9 and then push the green button, if they want to
10 share their data with others, and all of that,
11 that's something, and I think there's seven or eight
12 others that we already have in place.

13 For one big thing we are looking at is
14 a workforce management system that does everything
15 human resources and we think the Cloud options, and
16 that's probably the direction that we'll be heading,
17 but we are very risk adverse and slow in other
18 critical systems, and the point is when you invest
19 in a customer system, you know, it cost a hundred --
20 I think we wouldn't be building another customer
21 system, let's just say that's Craig Nelson's
22 speaking, but we are talking about \$200 million

1 creating a customer system. I don't think that's
2 going to happen.

3 I don't think there's a Cloud solution
4 out there yet for utilities that can handle the way
5 we are required to do billing by the Illinois
6 Commerce Commission, and then there's great concern
7 from an operation standpoint just for managing
8 storms and outages whether we should be tied to the
9 Internet or not or whether our own systems and our
10 own communication network is superior, so that if
11 the Internet goes out, we can't respond as well as
12 we could with our own system, so going slow.

13 On our customer system they are going
14 slow on these. Our core systems, we are updating
15 the systems, and we are moving in that direction.

16 As far as the capital investment, we
17 have already invested capital way, way beyond what
18 we have recovered in depreciation, and I would like
19 to get the accounting and ratemaking right.

20 As you said it more eloquently than I
21 did, Jim, these up-front costs should be spread over
22 the benefit of the contract. They should be focused

1 on the customers always. In the first year, that's
2 what we are suggesting.

3 Let's identify the up-front costs and
4 capitalize them as intangible assets and spread them
5 over the life of the contract. It's not that
6 different a concept, and I think we can identify
7 what those up-front costs are and they should be
8 over the contract.

9 COMMISSIONER ROSALES: Craig, you bring up a good
10 point. I want to go back to Jake, because you
11 mentioned about the financials, banking, health.
12 What happened at Anthem? It was such a major
13 breach. So if we are talking positives, we also
14 need to talk about how to answer when people ask
15 would Anthem have occurred, because it was in-house
16 and not out-house? What I'm looking for what if it
17 goes out?

18 There's a lot of questions that I
19 think regular consumers are going to have when this
20 comes up, and then I think there's so many good
21 positive questions, but we also have to make sure we
22 can we can answer all those questions.

1 MR. OSTER: I am certainly not a technical
2 expert. I haven't looked at every data breach, but
3 that happened to me personally.

4 MR. ABBO: When you say what if the Internet goes
5 out, I don't think that's an experience that we have
6 had.

7 COMMISSIONER ROSALES: I'm just talking about
8 what Craig mentioned.

9 MR. ABBO: I'll handle the technology updates,
10 regulatory, software development, but, yes, a lot of
11 these breaches that you are hearing about are
12 actually intrusions into corporate data centers, the
13 Targets, and the Anthems, and even the OPMs.

14 First of all, Anthems, basically these
15 are intrusions into non-Cloud data centers, and the
16 Cloud systems that Google run, Amazon run, and
17 others like those, basically have invested very
18 heavily in securing their systems to the point where
19 their investments are substantially larger than the
20 investments that most of these corporations
21 individually make.

22 To that thought, for example, like

1 Google and Amazon are constantly looking for
2 intrusions every single second of every single day.
3 If there's intrusions, they're on it immediately.
4 That is a huge investment on their part.

5 The problem is that OPM, Anthem, and
6 Target can't make those investments. They can't
7 afford it. So they're at a point where they really
8 need a very secure system. Google, Amazon are much
9 more secure than we can secure the application
10 systems behind corporate Target.

11 COMMISSIONER del VALLE: Has there even been a
12 Cloud breach?

13 MR. ABBO: Not to my knowledge.

14 COMMISSIONER del VALLE: It's possible?

15 MR. ABBO: It's possible, but they are always
16 looking for it every second of every day of
17 every -- they're basically on it.

18 COMMISSIONER del VALLE: But the data.

19 MR. ABBO: You know, is it possible? I can't
20 hypothesize as to whether it will or won't. There
21 are degrees of security that they can enable part of
22 it, which is being off the internet completely, so

1 you disconnect critical infrastructure --

2 COMMISSIONER del VALLE: I guess we ought to have
3 all governments -- all members of the government,
4 the federal government, going to the Cloud, then we
5 won't have a problem.

6 MR. ABBO: Certainly there's a lot moving to the
7 Cloud, and if you look at the analysts' forecasts,
8 75 percent of all the data will be in the Cloud by
9 2020. Last time I checked, 2020 is like around the
10 corner, four years from now, and so 75 percent is a
11 substantial amount of computing occurring in the
12 Cloud.

13 The other comment I would make is we
14 have some fairly small software technology companies
15 represented here. All our development I think is
16 basically Cloud-based, but I ran applications on
17 Oracle not that long ago and almost the entire
18 investment is basically being made in Cloud systems,
19 so I think any one of these situations where you
20 might be finding the current customer systems, but
21 the next generation will be a system that is
22 industry or architectural that runs on a Cloud

1 infrastructure.

2 That's not just small companies, it's
3 also very large technology companies, whether it's
4 Oracle, or SAP, or other providers in the market.
5 They're basically architecting and investing
6 99 percent of their innovation dollars on the next
7 generation technology, so I think this is
8 inevitable.

9 COMMISSIONER ROSALES: I agree. While I'm trying
10 to answer my own questions, and because I know this
11 is how the newspapers would put this in print, but
12 to me it would be at that point obsolete because you
13 are already uses the Cloud and there's enough data
14 out there where it's already here.

15 The question always comes up it's
16 years and now we are moving into another level, but
17 the question is always going to be there, and
18 especially when we are talking about utilities. If
19 you lose Target, you know, you are upset. You lose
20 your power and the grid goes down, that's a big
21 problem and that is the result.

22 MR. ABBO: I think that, again, this control

1 software is basically localized, and it's not in the
2 Cloud side, but I think that there's a lot that can
3 go to the Cloud, and certainly infrastructure
4 control software doesn't belong in the Cloud. So
5 there will always be embedded software and hardware
6 technology in control systems that are not in the
7 Cloud and, you know, there is a lot that can go into
8 the Cloud that's enormous with business value.

9 Again, the hardware and software
10 division in terms of buying capital, a lot of that
11 is -- a lot of those lines are broad. In order to
12 get value in this process, there is a hardware end
13 and a software end, and you don't have to look very
14 far in industries like the transportation or taxi
15 industry where Uber has a software-type model and
16 they haven't replaced cars, but it basically is able
17 to get a model and how you treat that, capital
18 expense or operating expense? That's beyond my pay
19 grade, but Uber is starting to become very tied to
20 the software, hardware processes.

21 MR. OSTER: I want to point out what you said,
22 and maybe answer a little bit about the Chairman's

1 question on how do we move towards Cloud-based
2 software and the experience with a utility we have
3 been working with and talking about procuring
4 software.

5 They hired a consulting firm to help
6 pull out and understand the landscape of software
7 updates, and they said to the company consultant we
8 really want on-site software. We want this looking
9 behind the firewall. We want something that's
10 on-premise solutions, and the consultant came back
11 to them and said it doesn't exist. If you want to
12 monitor what you want, you have got to go back to
13 the Cloud, and they're coming to us and we had a
14 conversation.

15 That is the transition that is
16 starting to occur in the industry. That is
17 unavoidable in that, as you said, for a company you
18 are not building modern software, so a little bit of
19 how do we get there, how do we do this, as far as
20 health care, finance, the industry is starting to
21 move up on its own agenda.

22 MS. SATTER: If I could just add a few comments

1 to the Chairman's question, I think that both of the
2 utility representatives on this panel and other
3 panelists have noted that utilities are using Cloud
4 computing for various functions, and I think one of
5 them in particular is in the energy efficiency
6 space, and, as far as the incentives go, energy
7 efficiency is treated as a separate mandate.

8 So there is an incentive mandate to
9 procure energy efficiency in a special
10 cost-of-recovery mechanism for efficiency services
11 and those services are already taken, especially I
12 think well suited to Cloud computing and, sure
13 enough, we are seeing Cloud computing there.

14 The other thing that I wanted to
15 mention in terms of cost recovery and incentives is
16 that in Illinois we have a unique situation. That
17 unique situation is the General Assembly passed the
18 infrastructure bill, the Smart Grid Deployment bill,
19 which has a special cost recovery mechanism. Every
20 year the electric companies are mandated to spend in
21 certain categories. They recover their costs. They
22 recover their investment costs, and they get a

1 reconciliation of costs that maybe weren't recovered
2 before. So all of the regulatory delay and the risk
3 associated with regulatory delay have been
4 essentially squeezed out of the process in Illinois.

5 So Illinois is unique. Whether
6 utilities are mandated to spend them, in other
7 words, what things have the General Assembly, our
8 policymakers, said? Yes, utilities, go forth and do
9 this. We think this is important. And I think the
10 utilities were on board with this. This is not some
11 mandate, for instance. The things include cyber
12 security for data, platforms to accept remote device
13 upgrades, internal memory, additional storage
14 capability functions, services without the need for
15 physical access to the meter. These things are the
16 law today.

17 So, to the extent that Illinois law
18 provides incentives, I think all we need to do is
19 look to Section 16-108.5 or maybe 108.6 which is
20 essentially the Smart Grid element.

21 But in terms of integration costs and
22 how they should be treated, I think it would depend

1 on how they're characterized, how they're
2 identified, but under the Smart Grade law, if
3 there's an annual expense -- not that this might be
4 just for ComEd; it might be a different number for
5 Ameren -- if there's an annual expense that's over
6 \$10 million, then the law says you can't tie to this
7 year, so that question has kind of already been
8 addressed in Illinois law.

9 In 2011 there was a lot of debate
10 about this law. I think the utilities put a lot of
11 energy into writing a law that provided the kinds of
12 incentives that they felt they needed to make these
13 investments. So Illinois is really unique and it's
14 really in a good position to adopt these
15 technologies, and they have been adopting them, you
16 know, when it makes sense.

17 The last comment that I want to make
18 has to do with accounting and the FASB, and that is
19 that the FASB has recommended a slight change. I
20 recognize it's a slight change in how you treat the
21 expense capital question, but that rule is a
22 national rule and it's used not just by utilities

1 but by all businesses for account reporting
2 purposes, and I think that there's some value in
3 recognizing that consistency.

4 So if there is going to be a change in
5 the treatment of that particular expense for one
6 state to do it without regard to the national rule
7 can create some problems I think for utilities, for
8 reporting multi-state utilities, but for reporting
9 as well. So I would just offer a caution on that.

10 I think we have a lot of treatments
11 already in place, a lot of processes already in
12 place to embrace change and to protect the utilities
13 and limit the risk that the utilities are adverse
14 to.

15 MR. JENKINS: If I could add a couple of things.
16 One is in terms of accounting, accounting can handle
17 different rate treatments by state, so 116 different
18 states where we have different treatments that
19 follow strict GAAP, some follow and others don't
20 follow. Accounting and publicly-traded companies
21 can handle it. That's my view on that.

22 What we really need to do is look at

1 the state, what makes -- what's in the public
2 interest, what really addresses the customer benefit
3 and make the decision, and that's what our
4 Commissioners are allowed to do there.

5 In terms of some of the water sectors,
6 a couple of things you raise. I just threw that out
7 there. There's some energy efficiency law that was
8 mentioned and access to that on the water side and
9 the sewer side.

10 The other policy issue to think about
11 is we have got in this state 1700 water and sewer
12 companies and 67 percent have less than 3300
13 customers, and what that means is American Water,
14 you know, we are engaged Smart, and looking at this
15 Cloud-based technology you have an issue in terms of
16 some of those communities being left behind some of
17 this technology.

18 I think that's just things that we
19 bring up to the Commission from time to time, and
20 this Commission's been, you know, on the edge of
21 some of these things with respect to trying to
22 consolidate water and sewer systems and trying to

1 look at being able to use fair market value for the
2 purchase price. I just throw that out.

3 There's a whole fragmentation out
4 there and there's other customers in the state that
5 with all this technology, at least in our sector, is
6 very much fragmented in electric and gas companies
7 that we wouldn't want to risk. Those systems don't
8 have the technology deployed to lead to detection
9 let alone in the accounting investment replacement
10 infrastructure, so I just throw that out as another
11 policy issue at the Commission.

12 DR. PETERSON: So I'm going to throw out a
13 question that I'm not sure what I'm going to get
14 from it, but the UK Reo process has been brought up
15 several times in this panel and in previous panels,
16 and that process is really an output-based
17 regulation process as opposed to our traditional
18 approaches input-based. We build our prices up on
19 cost. We apply prudence reviews and we move
20 forward.

21 If we were going to try to create an
22 output-based mechanism that will allow for

1 incentives for these types of mechanisms, how would
2 we measure those outputs and what would those
3 outputs be?

4 Part of the problem I think that I see
5 in this is that there are some real economies of
6 scope in the sense that you could provide multiple
7 services from the same types of technologies. And
8 how do we measure that type of stuff? How do we
9 know -- how does the Commission know we are putting
10 this money in that and we are getting something out
11 of it that is benefitting consumers?

12 (No response.)

13 I knew that was the response I was
14 going to get.

15 (Laughter.)

16 MR. ABBO: Well, I'll comment on what we have
17 seen there and then see how you might present
18 something here. But the Reo model actually looks at
19 those intangible things, things like reliability
20 networks. They're actually looking at the number of
21 connections that have industry generation
22 capabilities. They're actually measuring the number

1 of micro-generations, or what they call Senior
2 Selection Generation, actually generating
3 electricity connected to the grid, both the
4 individual level as well as the leading voltage
5 grid. They're actually measure very tangible
6 things, customer satisfaction, reliability of the
7 network over time.

8 In our experience, more broadly in
9 Europe, is that these performance-based systems, if
10 you have kind of a target achieving 40 minutes of
11 customer -- on average customer outage per customer
12 and you are actually operating below that, there's a
13 potential performance incentive associated with
14 that.

15 If you are operating above that higher
16 than 40 minutes, there's a penalty associated with
17 that, and these are huge motivators for these power
18 companies in Europe, and you can look at the past
19 couple of months, actually the summer, that one of
20 the European companies had a fine of 26 million
21 Euros, because they had power outage for three days,
22 and so these are performance-based systems and they

1 have very tangible elements that they're actually
2 cheaper which really drives the behavior quite
3 nicely.

4 MS. SATTER: I might suggest that the
5 telecommunications industry have had a
6 performance-based approach for many, many years, and
7 that could provide some models.

8 Now in the telecommunications
9 industry, it was generally acknowledged that it was
10 cost that define the industry, so everybody knew
11 that the digitization, if you will, of a network has
12 reduced costs substantially.

13 So, as a result, we had a price cap
14 system and then ratcheting it down to where it drove
15 efficiency while recognizing that there were
16 efficiencies to be had. I can't quantify that on
17 the electric side. I don't know whether that system
18 or that results can occur as a result of IT and
19 outsourcing these various functions, but I do know
20 that regardless you have got to maintain your poles,
21 and your wires, and your substations, just like the
22 telephone company had to maintain their equipment

1 and infrastructure.

2 So I'm just thinking that's one way to
3 do it which drives efficiencies while recognizing
4 that there are savings to be had. It's a model, now
5 and, again, in Illinois we have formulary law and
6 there are incentives in that law. There's
7 expectations that because of the investment that was
8 authorized, certain performance metrics would either
9 be met or exceeded, and if they weren't, then there
10 would be a penalty, so it was more of a stick than a
11 carrot, because the expectation was that if we give
12 you this money, this will be the result.

13 So we do have a form of an incentive.
14 Whether you think it's efficient or not, I am not
15 going to comment on, but, again, we have this rather
16 unique law in Illinois where a lot of cases do and
17 those kinds of incentives are working.

18 MR. OSTER: I won't pretend to be as experienced
19 in this area more than I need to know, and I will
20 cheat a little bit, and I happened to have New York
21 Rev that I obtained and I just typed them out for
22 something today.

1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20
21
22

(Laughter.)

I know this is the world we live in. So, you know, in Rev there's a point where the white paper is outlined, so I outlined not the whole list but four or five distinct categories that they have on their system.

The first one is production. The second one is energy efficiency of which 10 percent of key production has to come from energy efficiency, next improve customer engagement and information, so building a customer information platform, and then measuring how many of your customers are actually reaching through that platform. Next is affordability, what kind of programs are you creating to get at low-income customers and how many shutoffs are you avoiding in less than a year, and then, lastly, the connection, so the score, the input and the lifeline.

So that's how New York is handling it so far. That's just a discussion in progress. At least it's a starting point.

MR. NELSON: Just as the legislature imposes

1 performance metrics on utilities, it makes great
2 sense to impose performance metrics on Cloud
3 Computing Arrangement contracts, and although I
4 think it would be one way to take away only, I would
5 hope there's incentives both ways, but measuring,
6 for example, analytical data, all kinds of metrics,
7 depending upon what measure of the system, whether
8 it's a resource system, or a billing system, or an
9 operational system, things that we're measured on,
10 like duration of outages and frequency of outages
11 would be right up there, and things we like to
12 measure and things that we like the customers --
13 again, things that we were held accountable for
14 measuring with Cloud computing to providers. So we
15 are all about metrics, and I think they should be
16 used other times.

17 MR. ABBO: And just to respond for Cloud
18 computing technology providers, we actually do
19 measure through the software of the business
20 metrics.

21 At Baltimore Gas and Electric, the
22 energy reading meters that might be misreading, all

1 that is measured through the system, and then also
2 the system uptimes also part of level agreements
3 that we have in place, and so this whole
4 accountability from the technology stack all the way
5 to this processing. Obviously, it is not just us.
6 It's also working with the utility operators to make
7 sure that those actually occur.

8 DR. PETERSON: Well, we have got a few minutes
9 left, and I think in those final minutes what I'll
10 give everyone an opportunity to do is to directly
11 talk to the Commission about what you think the role
12 of the Commission should play, either in the short
13 run, you know, perhaps in the next 6 to 12 months or
14 maybe in the longer term period to help address
15 these issues, and in particular issues that we
16 talked about on Panel 4 here.

17 I know this issue of rulemaking has
18 come up and if you can provide some details on
19 exactly what you might want the Commission to do and
20 how to move forward with that, and we'll take a few
21 minutes and do that, and then we will turn it over
22 for some questions.

1 MR. O'KEEFE: Sure. Thanks again. I'm thinking
2 as I'm going through the day and I think that what's
3 really exciting is that through the recognition of
4 the value of Cloud-based software solutions, as well
5 as in some ways the inevitability, but I still think
6 there is some time for the Commission to consider
7 truly whether it's a level playing field at this
8 point and whether or not the utilities are
9 encouraged to assess all solutions equally given the
10 current infrastructure.

11 I need a lot of micro-questions to
12 resolve around accounting, around how these parts
13 are paid for, and why they are set the way they are
14 with subscription fees, et cetera, and certainly
15 look to companies like ours to help address those
16 question, but ultimately we are just dealing with
17 this analogy that I used all the data -- I think I
18 found my opportunity -- which is that you wouldn't
19 care when a utility's putting up a pole if they
20 owned the forest or if they bought that pole from
21 someone else, and that's fundamentally the
22 simplicity of this discussion from our perspective.

1 Do they fully own that forest
2 forgetting that timber firm or did someone cut it up
3 for them and put it in there? And with the software
4 and the service versus the long-term solution
5 method, that's all we are dealing with, and if we
6 are going to still be about pull up and they still
7 carry those wires, and the same is true on this side
8 of the policy-built technology.

9 So thanks for considering all of our
10 perspectives today and I look forward to any
11 questions.

12 MS. MEIER: The benefit of what someone
13 previously said are taken care of, so I will keep it
14 short. I think when we think about the basics, I
15 think the number one thing I would ask the
16 Commission to think about is I think everybody in
17 this room agrees that this migration of Cloud
18 software is inevitable, and it's coming, but I
19 wouldn't count on that inevitability to be the
20 driver for utilities and this industry to adopt
21 Cloud software as quickly and as efficiently as
22 other industries have and continue to do.

1 And so I think that today has been a
2 wonderful start and I hope that this process
3 continues through rulemaking, through further
4 conferences. I think these kinds of conversations
5 are going to be needed because honestly both sides
6 of the chasm, if you will, are so unfamiliar with
7 how the other side works. That's a big part of why
8 I think it's taken a little bit longer, so these
9 conversations are absolutely vital.

10 So I would just say don't count on
11 that long term, maybe we will get there eventually,
12 because I keep hearing on the panel eventually. No
13 one's even going to make on-premise software. If we
14 all agree that Cloud solutions are faster, they're
15 more flexible, they're cheaper, let's get those out
16 there.

17 MR. OSTER: I also want to echo the comments of
18 my colleagues and also thank the Commission for
19 having us here today. Obviously, this is important,
20 and for the Commission to do this and it's exciting,
21 and I'm really pleased to be part of this
22 discussion.

1 I also want to echo what Mariko said.
2 I don't want to imply that because on-premise
3 software will no longer exist that we shouldn't be
4 more in-tuned.

5 I'm thinking if I had to think of one
6 or two things that the Commission should do and
7 consider before I leave here today, the first would
8 be to synchronize or assess standardization for
9 security protocols of software, whether it's for
10 statewide utilities or state utilities.

11 One of the challenges for companies
12 like ours is that data security protocols that
13 different utilities have in place. So if the state
14 wants to encourage moving for a Cloud-based software
15 learn about security protocols that are out there
16 and setting the bar for utility goals. That will be
17 easier for companies like ours.

18 I look at Amazon web server protocol.
19 It's just it's incredibly long. There's certainly a
20 lot of them out there, and so there are security
21 protocols out there. They are very small. Setting
22 standards, I think that would be very helpful.

1 There is the third thing I suggest I
2 think, you know, and clearly we all recognize the
3 gap between a number of things versus the
4 Cloud-based software. Some of us will not invest in
5 neither one, but I say just as important for the
6 Commission to get different types of software
7 systems and what's meter deployment, time and value,
8 and costs are as a result of Cloud-based software
9 system services on-site. In order for you to have
10 your economists to be able to assess those decisions
11 and make investments, you have to understand what
12 the value and the economies are that could lead to
13 on-based software.

14 Again, I'm not an expert on that, but
15 there are things that you have to know in order to
16 be able to take on that role, and I say that's an
17 important step for the Commission to consider going
18 forward. I will leave it at that. Again, I want to
19 thank you again for your questions.

20 MR. ABBO: Really quickly, again, thanks again
21 for having this forum. I think the problems of the
22 smart grid is moving from hardware up to now

1 basically a software enabled system. That's what's
2 going to lock the of value in the smart grid.

3 So I would encourage you to think
4 about a multi-year plan of basically what are the
5 benefits in the smart grid, and what are the costs,
6 what are the software components, and basically put
7 a plan in place that fits some of the best practices
8 on a level playing basis in the system, understand
9 the benefits to the consumer, understand the
10 benefits of the operation of the utilities, and, you
11 know, there's no longer simply putting in sensitive
12 service wise -- well, Cloud-based processes that
13 premises that for in-site and for the operational
14 aside lower customer bills, et cetera.

15 There is a plan that needs to be in
16 place multi-year to unlock those values and set
17 \$200, \$300 per year to consumer and to the
18 utilities. Thank you.

19 MR. NELSON: As I said earlier, the FASB updates
20 are bright lines and hard tests, and so Cloud
21 computing arrangements either all capital or at
22 their own expense. Unfortunately, the test is such

1 that it's not going to be equitable, and so what we
2 are proposing is that there is a middle ground here
3 for up-front costs and fees to be capitalized.

4 In relation to that, we have an order
5 of rulemaking, so we will see investing in
6 workshops, followed by an order, rulemaking, and
7 capitalize. The Commission probably should go
8 further to say interaction as much as it deems that
9 it wants to go in the direction of Cloud computing,
10 and whether we are going to move in that direction
11 or each time consider an IT change, we have to
12 extend that along with all the other options, some
13 directions to the utilities about how much of a push
14 we make to the Cloud, so fix the accounting and
15 ratemaking, give us some direction. We don't have
16 far to go.

17 MR. JENKINS: I think Craig covered really what
18 in one word the history as we went through this, as
19 I sat through the day. I mean, this Cloud computing
20 is absolute, and I know that it's the wave of the
21 future. I think these issues are going to continue
22 to get bigger and bigger. That's the reason

1 integration costs are more and more important;
2 otherwise, you can, in an informal ratemaking or in
3 rate cases like in the water sector, put a handle on
4 performing costs in a test year.

5 So that needs to be handled and
6 addressed by this Commission for years, and that's
7 just the right balance in terms of energy
8 generation, equity and clarity in this period will
9 get the help, because the new accounting rules add a
10 level of confusion that is just going to get stalled
11 in terms of just getting things deployed as quickly
12 as we might.

13 But other than that, I just really
14 want to appreciate the Commission bringing these
15 issues before us, and I think it's important and I
16 will continue to talk about the benefits of Cloud
17 computing for years to come.

18 MS. SATTER: Thank you. I just a few comments.
19 First of all, I appreciate that the vendors of Cloud
20 computing think it's a great service, that it's the
21 future and that they want to expand into the utility
22 space, and I think that's fine. That's reasonable

1 and that makes sense, but as utility regulators,
2 that is regulators that offer an essential service
3 everybody needs, whether they're on a \$600 monthly
4 fixed income or a \$600,000 annual income, these
5 services have to be available to everybody.

6 As a result, Illinois law requires
7 that service and costs be the least cost, so I would
8 suggest that in looking at these services are they
9 least cost? Is capitalizing across least cost
10 compared to expensing, especially when you look at
11 all the other expenses that utilities have to
12 address, all the other capital expenses in
13 particular.

14 Ordinarily, the Commission, the
15 regulatory body, does not direct particular
16 expenses. Let me step back a little bit.

17 The utility manages its own business.
18 The regulators -- consumer advocates we don't
19 micro-manage the utilities. We say you know your
20 business. You know what you have to do but be
21 guided by the least cost principle.

22 So we would hope that when you review

1 these, just as you utilities are guided by the least
2 cost principles, you are guided by the least cost
3 principles.

4 And I say to the vendors the same
5 thing. We understand that this is a
6 forward-looking, very valuable service and that it
7 really has great potential, so what I would say to
8 you is go out and develop product services, create
9 services that will meet our needs that are least
10 cost and sell them, sell them to our utilities, make
11 it better, and really I feel like at this point it's
12 kind of up to the vendors to come up with really
13 good products, least cost products, that the
14 utilities cannot say no to and their regulators will
15 not only not say no to but say thank you. So I
16 think that that is kind of the next step.

17 This has been an eye-opening
18 experience. I appreciate seeing this part of the
19 business, this part of the world. On the other
20 hand, it's not completely new, particularly in the
21 energy efficiency space and demand response space.
22 We know that's been going on, but it's out-sourcing

1 other functions, such as billing, such as HR, human
2 resources, such as other operational functioning
3 should those be out-sourced? On what terms?

4 These are very complicated questions,
5 so please package something. That's what vendors
6 do, and so I think that that would be how I would
7 see next steps.

8 DR. PETERSON: Thank you, Sue.

9 We have time for maybe one question.
10 Commissioners. I always wanted to say this
11 hearing then --

12 CHAIRMAN SHEAHAN: I think everyone is out of
13 gas. I would like to thank all of you again for
14 taking the time in joining us today. We have been
15 very fortunate to hear from experts in the field and
16 I think it's safe to say we have all learned a great
17 deal.

18 I would like to offer special thanks
19 to Anastasia and Elizabeth for their assistance in
20 organizing today's forum and to Paul Reiser for his
21 technical support.

22 The issues that have been raised today

1 are only going to become more prevalent as the
2 technology advances. I can't overstate the
3 importance of continuing to have events like this to
4 educate each other and be a catalyst for change in
5 this industry. Everyone here is interested in the
6 impact of cloud-base technologies, and I ask that as
7 we leave today, let's continue to think about the
8 next steps in making these ideas a reality and how
9 we can be technology enabled.

10 I can't thank all of you enough for
11 joining us. I know many of you have come from great
12 distances. Thank you again for being here
13 participating. Thank you.

14 (Applause.)
