A. Witness Identification	1
B. Summary of Testimony	1
C. Itemized Attachments	3
II. Secondary and Service Loss Study	3
III. Distribution System Loss Study	7

1 **I. Introduction**

2 **A. Witness Identification**

3 **Q. What is your name and business address?**

4 A. My name is Michael F. Born. My business address is Two Lincoln Centre, Oakbrook  
5 Terrace, Illinois 60181-4260.

6 **Q. By whom and in what position are you employed?**

7 A. I am employed by Commonwealth Edison Company ("ComEd"). At the time I filed  
8 direct testimony, I held the position of Principal Engineer in the Distribution Capacity  
9 Planning Department. I have been recently promoted to Manager, Distribution Capacity  
10 Planning, where my duties include planning, directing, and assessing the activities of  
11 three managers and about 30 engineers and technicians responsible for forecasting  
12 distribution feeder and substation annual peak loads, development of least-cost, reliable  
13 capacity expansion plans and appropriate alternatives, and analysis of distribution feeder  
14 adequacy.

15 **Q. Are you the same Michael F. Born who provided direct testimony in this**  
16 **proceeding?**

17 A. Yes.

18 **B. Summary of Testimony**

19 **Q. What is the purpose of your rebuttal testimony?**

20 A. The purpose of my rebuttal testimony is to respond to the direct testimony of Staff  
21 witness Greg Rockrohr, Staff Exhibit ("Ex.") 5.0, regarding ComEd's proposed

22 Distribution System Loss Study, ComEd Ex. 10.6<sup>1</sup>. In particular, I address the following  
23 concerns raised by Mr. Rockrohr: (1) inconsistencies between the number of customers  
24 per service shown in the list of customer category models in Appendix 1 of the  
25 Secondary and Service Loss Study dated June 13, 2012 and the loss model diagrams in  
26 Appendix 2; (2) discrepancies between the entries for the secondary and service system  
27 elements in Appendix C of ComEd Ex. 10.6, the 2011 Distribution System Loss Factor  
28 Study, and the percent of the load in each customer category that utilize those elements;  
29 and (3) the size of the samples of customers that were utilized to develop representative  
30 models for the estimation of losses in secondary and service conductors in the Secondary  
31 and Service Loss Study.

32 **Q. In brief, what conclusions do you reach?**

33 A. The 2011 ComEd Distribution System Loss Factor Study and the ComEd Secondary and  
34 Service Loss Study accurately reflect the distribution losses on ComEd's system and  
35 appropriately separate secondary and service elements, respectively. Nonetheless, to  
36 address Mr. Rockrohr's concerns, both studies have been revised to appropriately and  
37 more transparently reflect the data used to compute both distribution losses and to  
38 separate secondary and service losses. As regards to the sample size, the results of the  
39 Secondary and Service Loss Study are reasonably accurate. However, I understand Mr.  
40 Rockrohr's concern in this regard. Examining additional samples will take considerable  
41 time. Given the time constraints of this proceeding and the revenue neutral effect of the

---

<sup>1</sup> ComEd Ex. 10.6 was filed on June 13, 2012 in compliance with the Administrative Law Judges' Notice of Ruling dated June 6, 2012 and the Illinois Commerce Commission's final Order in ICC Docket No. 11-0721 dated May 29, 2012.

42 Distribution System Loss Study, I will be happy to work with Staff to examine additional  
43 samples and, depending on the results of that analysis, prepare a new Secondary and  
44 Service System Loss Study for submission at the outset of the next proceeding in which  
45 the subject can appropriately be considered, specifically the revenue neutral cost of  
46 service and rate design proceeding that will be conducted in 2013.

47 **C. Itemized Attachments**

48 **Q. What exhibits are attached to your testimony?**

49 A. I have two attachments to my rebuttal testimony. ComEd Ex. 17.1 is a revised ComEd  
50 Secondary and Service Loss Study. ComEd Ex. 17.2 is a revised Distribution System  
51 Loss Study.

52 **II. Secondary and Service Loss Study**

53 **Q. Mr. Rockrohr raises a concern regarding the values assigned to the Single Family**  
54 **("SF") customer category in Appendix 1 of the ComEd Secondary and Service Loss**  
55 **Study as they appear inconsistent with the schematic models for the SF customer**  
56 **category in Appendix 2 of that study. Staff Ex. 1.0, 3:47-4:70. Before addressing**  
57 **Mr. Rockrohr's concern, can you explain what the ComEd Secondary and Service**  
58 **Loss Study is?**

59 A. Yes. On page 291 its Final Order in ComEd's 2010 Rate Case (dated May 24, 2011),  
60 ICC Docket No.10-0467, the Illinois Commerce Commission directed that with regard to  
61 the Distribution System Loss Study, ComEd separately consider the secondary and  
62 service elements of the Distribution Loss Factors. Secondary elements consist of low-  
63 voltage secondary conductors that can supply multiple customers, such as those that exist

64 along streets, alleys and within utility easements. The service elements consist of those  
65 conductors on private property and supply individual customers. Thus, the Secondary  
66 and Service Loss Study provides the basis for estimating the peak losses in secondary and  
67 service conductors by customer category.

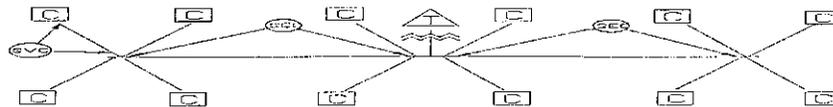

68 Q. **Can you explain the analysis used to estimate the peak losses in secondary and**  
69 **service conductors by customer category for the Secondary and Service Loss Study?**

70 A. Yes. In order to compute losses associated with secondary and service conductors,  
71 ComEd began by analyzing various system configurations of secondary and service  
72 conductors that provide service to ComEd customers. Various configurations need to be  
73 considered because the location of customer and company facilities; magnitude of peak  
74 load; and design standards in effect at the time of installation can result in differences in  
75 the facilities that supply individual customers. For the purpose of this study, conductor  
76 types and configurations contained in current ComEd engineering standards were used.  
77 Because of the numerous configurations, a random sample of 10 customers in each of the  
78 customer categories was used to determine how often secondary and service conductors  
79 occurred on ComEd's system in overhead, underground or high-rise configurations. For  
80 example, in a densely populated urban area there will be more secondary conductor  
81 sections and more customers served from an overhead secondary conductor than in a  
82 suburban or rural area.

83 An electrical power flow model for each of the representative configurations used  
84 to provide service to each customer category was then developed based on an analysis of  
85 the sample of customers. For example, the model in Diagram 1 below was developed as

86 a configuration for single family customers in a suburb with overhead conductors (*see*  
87 Appendix 2 of ComEd Ex. 17.1). Diagram 1 demonstrates that in this configuration, two  
88 secondary conductors (“SEC”) each serving four customers (“C”) and four customers are  
89 served directly from the transformer. Further, Diagram 1 shows that each customer (“C”)  
90 is served by an individual service (“SVC”).

91 Diagram 1

92  
93 The power flow simulation used by ComEd identifies the losses in each conductor  
94 section. From the simulation results, the secondary and service power losses can be  
95 determined by summing the losses for the conductors used for secondary and service  
96 purposes separately. The losses for each model were then divided by the total customer  
97 load in the model to determine losses as a percent of the load. For customer categories  
98 that are supplied by more than one model of secondary and service conductors, the losses  
99 for that category were determined by weighting the losses of the applicable models by the  
100 frequency of occurrence of the applicable model in the sample of customers by category.  
101 These percentages are used for separating secondary and service conductor losses in  
102 Appendix C and Appendix D of the Distribution System Loss Study.

103 Q. **Returning to Mr. Rockrohr’s concerns regarding Appendix 1 of the ComEd**  
104 **Secondary and Service Loss Study, how do you respond?**

105 A. Mr. Rockrohr observation is correct. In Appendix 1 of ComEd Ex. 10.6, the values  
106 shown in the column labeled as “# of Customers on Service” actually represent the  
107 number of customers on the Secondary conductor in that model. In ComEd Ex. 17.1, the  
108 label for this column in Appendix 1 has been revised to show “# of Customers on Each  
109 Secondary”. To provide additional explanation and clarity, an additional column has  
110 been added to the tables in Appendix 1 to show the number of customers per service for  
111 each of the loss models.

112 Q. **Also, with respect to the ComEd Secondary and Service Loss Study, Mr. Rochrohr**  
113 **expresses a concern regarding the use of only ten service installations in samples for**  
114 **most customer categories in order to determine its use of secondary and service**  
115 **elements to supply the category. Staff Ex. 1.0, 6:123-132. How do you respond?**

116 A. I agree with Mr. Rockrohr that ten service installations is a small sample for customer  
117 categories. I nonetheless believe that, based on sound engineering judgment, experience,  
118 and information from others interviewed for this study pertaining to a wide variety of  
119 secondary and service configurations, the percentages resulting from the study are  
120 realistic.

121 Q. **Why are the percentages resulting from the study realistic?**

122 A. The loss percentages from this analysis are realistic since various representative  
123 configurations including overhead and underground configurations; suburban, urban and  
124 high-rise locations are all included in the random samples that were used to develop the  
125 loss models. Further, the conductor types and sizes have realistic load to capability ratios  
126 for the customer loads used in each of the models.

127 Q. **What impact is likely to result from increasing the sample size in the Secondary and**  
128 **Service Loss Study?**

129 A. Being familiar with ComEd secondary and service configuration practices for over 40  
130 years, any changes would be de minimis. However, to address Mr. Rockrohr's concerns,  
131 ComEd will work with Staff to increase the number of customers in the sample for each  
132 of the four largest customer categories to determine if the current weighting of models is  
133 appropriate. Additional samples will be examined in the Single Family without Space  
134 Heat, Multi-Family without Space Heat, Small Load and Multi-Family with Space Heat  
135 categories. However, considering the work required to expand the sample size for these  
136 customer categories, this effort cannot, as a practical matter, be completed in the  
137 timeframe of this proceeding. ComEd is prepared to work with Staff to complete this  
138 additional analysis as promptly as practical. I recommend that work on that analysis  
139 proceed and that the results of that analysis be presented in an updated Secondary and  
140 Service Loss Study and Distribution System Loss Factor Study to be submitted at the  
141 outset of the revenue neutral cost of service and rate design proceeding that will be  
142 initiated in the first half of next year. I believe that this is a reasonable approach as it is  
143 my understanding that any changes in the calculation of the distribution loss factors will  
144 primarily impact cost allocations in the Embedded Cost of Service Study.

145 **III. Distribution System Loss Study**

146 Q. **With respect to the Distribution System Loss Study, Mr. Rockrohr raises concerns**  
147 **regarding several percentages in Appendix C, entitled "2011 Loss Factors – Percent**  
148 **of Category Load Through Elements." In particular, Mr. Rockrohr testifies that**

149 **the service elements should have been at or near 100% for the Single Family (“SF”)**  
150 **customer category and Single Family with Electric Space Heat (“SF\_SH”) and not**  
151 **at 100% for the 0-100kW customer category. Staff Ex. 1.0, 4:71-5:105. How do you**  
152 **respond?**

153 A. Mr. Rochrohr is correct that every customer category uses service conductors, although  
154 not every customer category uses secondary conductors. Accordingly, in ComEd’s  
155 revised Secondary and Service Loss Study, ComEd Ex 17.1, the size and length of the  
156 service conductor is listed in Appendix 1 for each customer category and loss model. To  
157 clarify the values of secondary and service conductor losses for each customer category  
158 that were used in the Distribution System Loss Factor Study, an additional table is  
159 included in Appendix C that lists the results of the 2012 ComEd Secondary and Service  
160 Loss Study.

161 Q. **Also, with respect to Appendix C of the Distribution System Loss Study, Mr.**  
162 **Rockrohr recommends deletion of rows 19 and 20. Staff Ex. 1.0, 5:106-6:122. Do**  
163 **you agree?**

164 A. Yes. ComEd Ex. 17.2 reflects this change.

165 Q. **Does this complete your rebuttal testimony?**

166 A. Yes.
