Docket No. 12-0598

DIRECT TESTIMONY OF K. DOUGLAS BLODGETT

I.

INTRODUCTION AND OVERVIEW

Q. Please state your name, business address and describe your position with The Nature Conservancy.

A. My name is K. Douglas Blodgett. My business address is 11304 N. Prairie Road, Lewistown, Illinois 61542, which is The Nature Conservancy’s Illinois River Program Office. I serve as Director of River Conservation for the Illinois Chapter of The Nature Conservancy. One of my primary responsibilities is overseeing implementation of The Nature Conservancy’s Conservation Action Plan for the Illinois River and its associated strategies for conserving the biological diversity of this large-floodplain river ecosystem. A primary strategy of that plan is

12 restoration and management of functional floodplain. I oversee The Nature
13 Conservancy's model landscape-scale floodplain projects along the Illinois River
14 -- the 1,195-acre Spunky Bottoms Project located in Brown County (also known
15 as the "Merwin Preserve at Spunky Bottoms") and the 6,600-acre Emiquon
16 Preserve located in Fulton County. I am also involved in The Nature
17 Conservancy's conservation efforts on the Wabash, Cache, and Mississippi
18 Rivers. I am part of The Nature Conservancy's Great Rivers Partnership, which
19 facilitates sharing of science and conservation lessons learned among managers
20 and decision makers responsible for the health of large rivers throughout the
21 United States and around the world.

22

23 **Q. What is your educational background and work history?**

24 A. I earned B.S. and M.S. degrees in biology from Western Illinois University at
25 Macomb, IL. Prior to joining the staff of The Nature Conservancy, I worked for
26 the Illinois Natural History Survey from 1982 through 1998, participating in
27 biological investigations on the Illinois and Mississippi Rivers with special
28 interests in freshwater mussels, fishes, and exotic species. From 1989 through
29 1998, I was director of the Illinois Natural History Survey's Long Term Resource
30 Monitoring Program Field Station on the Illinois River at Havana, part of the
31 multi-state/multi-agency Upper Mississippi River Restoration Environmental
32 Management Program (EMP). I joined The Nature Conservancy staff in 1998 as
33 Great Rivers Area Director, and have been involved with The Nature
34 Conservancy's large river work since that time. In that role, I oversee The Nature

35 Conservancy's model landscape-scale floodplain projects along the Illinois River,
36 including the Spunky Bottoms Project.

37

38 **Q. Have you previously submitted testimony to the Illinois Commerce**
39 **Commission?**

40 A. No.

41

42 **Q. What is The Nature Conservancy?**

43 A. The Nature Conservancy is a not-for-profit organization with a clear mission -- to
44 conserve the lands and waters on which all life depends. We do that by protecting
45 ecologically important lands and waters for nature and people.

46

47 **Q. What are the interests of The Nature Conservancy in this proceeding?**

48 A. Ameren Illinois Transmission Company ("Ameren") is seeking permission to
49 route an electric transmission line across the State of Illinois and has proposed a
50 "Primary Route" and an "Alternate Route" for the line. As discussed in further
51 detail below, Ameren's routes cause various serious concerns regarding ecological
52 impacts. While The Nature Conservancy is interested in preserving and
53 protecting natural habitat on the entire length of the routes proposed by Ameren,
54 the Meredosia to Ipava portion of Ameren's proposed routes would have a
55 particular impact on lands and waters with extraordinarily high conservation
56 value. Accordingly, The Nature Conservancy has focused its intervention efforts
57 on this segment.

58 Most significantly, Ameren's proposed Primary Route intersects land owned in
59 fee by The Nature Conservancy. The land makes up the Spunky Bottoms
60 Preserve, which is part of the Spunky Bottoms Complex -- over 2,100 acres
61 owned and managed collaboratively by the Illinois Department of Natural
62 Resources (833 acres) and The Nature Conservancy (1,195 acres). The Nature
63 Conservancy's Spunky Bottoms Preserve consists of a mosaic of restored
64 floodplains and uplands. Ameren's Primary Route also crosses an adjacent 90-
65 acre parcel over which The Nature Conservancy holds a conservation easement.
66 (See Exhibit 1.1 for a Map of the Spunky Bottoms Preserve and adjacent lands).
67 The Spunky Bottoms Complex is part of an 8-mile corridor of conservation lands
68 along the Illinois River.

69 The Nature Conservancy has proposed an alternative route (with two variations)
70 for the Meredosia to Ipava portion that would be preferable to either of the routes
71 proposed by Ameren.

72

73 **Q. What is the purpose of your direct testimony?**

74 A. The purpose of my testimony is to explain the ecological importance of the
75 Spunky Bottoms Preserve and other natural habitats that would be significantly
76 disturbed by Ameren's proposed siting of its 345 kV electric transmission line.

77

78 **Q. What other direct testimony is The Nature Conservancy presenting in this**
79 **proceeding?**

80 A. Dr. Jeff Walk, who serves as the Director of Conservation Science for The Nature
81 Conservancy's Illinois Chapter will further explain the harm that would be caused
82 by Ameren's proposed Primary and Alternative Routes to the natural ecology of
83 the Spunky Bottoms Preserve and other lands and waters. Dr. Walk will also
84 discuss the alternative route identified by The Nature Conservancy and why it
85 would be preferable to either of the routes proposed by Ameren. Dr. Michael
86 Patrick Ward, who is an Assistant Professor of the Department of Natural
87 Resources & Environmental Sciences at the University of Illinois at Urbana-
88 Champaign will discuss the detrimental impact of Ameren's proposed Primary
89 and Alternate Routes on species of conservation concern, specifically with respect
90 to bird species that are endangered, threatened, or otherwise of conservation
91 concern.

II.

AMEREN'S PROPOSED PRIMARY ROUTE WOULD THREATEN RESTORED PLANT AND ANIMAL COMMUNITIES AT THE SPUNKY BOTTOMS PRESERVE

99 **Q. Please describe the work being done by The Nature Conservancy in**
100 **connection with the Spunky Bottoms Project.**

101 A. At Spunky Bottoms, The Nature Conservancy is working with partners to restore
102 and sustain natural ecological processes and floodplain habitats that contribute to
103 the ecological health of the Illinois River, including the native plant and animal
104 communities in, on and around the river.

105 Most of our property at Spunky Bottoms had been leveed and converted to
106 agriculture early in the 20th century. Since restoration started in 1999, we have
107 worked to restore a more natural hydrology, and have planted prairie and
108 bottomland hardwood trees. While restoration to date has been quite successful,
109 we continue efforts to control invasive species, manage hydrology, and ensure the
110 long-term sustainability of these important habitats and ecological processes.

111 Additional information about the Spunky Bottoms Preserve is available at:

- 112 • [http://www.nature.org/ourinitiatives/regions/northamerica/unitedstates/illinois](http://www.nature.org/ourinitiatives/regions/northamerica/unitedstates/illinois/placesweprotect/spunky-bottoms.xml)

119

120 **Q. Why did The Nature Conservancy purchase the properties that comprise**
121 **Spunky Bottoms?**

122 A. The Nature Conservancy has a variety of goals for the Spunky Bottoms Preserve.
123 The restoration of functional floodplain has been identified in numerous studies
124 and planning efforts as a critical component of restoring and maintaining the
125 ecological health of the Illinois River ecosystem (a significant part of the Upper
126 Mississippi River System, defined by Congress as a nationally important
127 ecosystem in the Water Resources and Development Act 1986). Examples of
128 such studies and planning efforts include:

150

151

152

At Spunky Bottoms, The Nature Conservancy is developing and implementing

153

techniques for restoring and maintaining the important natural ecological

154

processes and habitats that support native plants and animals on the Preserve and

155

in, on and around the river. Since restoration began in 1999, 238 bird species

156

have been documented at the Spunky Bottoms Preserve, including many rare

157

species. Approximately 20 threatened and endangered plant and animal species

158

have been identified there. Additionally, the Spunky Bottoms Preserve is being

159

used as a model to guide the proper restoration and management of other

160

floodplain areas.

161

162

Q. What other organizations have been involved with the Spunky Bottoms

163

Preserve?

164 A. The Spunky Bottoms Preserve has attracted active participation from many
165 partners including the US Army Corps of Engineers, Natural Resources
166 Conservation Service (US Department of Agriculture), Illinois Department of
167 Natural Resources, Illinois Natural History Survey, National Fish and Wildlife
168 Foundation, North American Wetlands Conservation Council, numerous colleges
169 and universities, other not-for-profit conservation organizations, and the public.
170 In addition to supporting an amazing abundance and diversity of native fish and
171 wildlife species (aquatic and terrestrial and resident as well as migratory), the
172 Spunky Bottoms Preserve has become a living laboratory for developing
173 floodplain restoration techniques and training scientists.

174

175 **Q. What is the importance of floodplain restoration to the Illinois River**
176 **ecosystem?**

177 A. Floodplain restorations are extremely important both locally and systemically.
178 The natural floodplain of the Illinois River (i.e. before the levees were
179 constructed) afforded numerous benefits to nature and people, including providing
180 habitat for an abundance and diversity of native plants and animals (terrestrial and
181 aquatic, resident and migratory); processing/cycling nutrients and sediment and
182 breaking down pollutants, thereby improving water quality; contributing to a
183 more natural river hydrology, including reduced flood damages; sequestering
184 carbon and mediating climate change; and providing opportunities for education,
185 recreation and compatible economic development.

186 Almost half of the Illinois River's natural floodplain was leveed and converted to
187 agriculture a century ago, nearly eliminating most of the aforementioned benefits
188 on those lands. And since then, remaining floodplains along the Illinois River
189 have been severely degraded by unnatural hydrology; pollution and poor water
190 quality, including excessive sediment loads; and invasive species. As a result,
191 high-quality functional (naturally working) floodplain habitats that provide those
192 services are now in short supply and are badly needed. The overall ecology of the
193 Illinois River, including those natural plant and animal communities it supports,
194 has declined. Because of land ownership patterns, opportunities for restoring and
195 sustaining functional floodplain are very limited.

196 The Spunky Bottoms Preserve is one of only a handful of important floodplain
197 restoration sites where land ownership allows the restoration and maintenance of
198 functional floodplain wetlands along the Illinois River.

199

200 **Q. What work has gone into restoring the Spunky Bottoms Preserve and**
201 **preserving its conservation value?**

202 A. After a planning process that included a variety of partner organizations,
203 restoration began in 1999. Initial efforts included seeding native prairie, planting
204 bottomland hardwood trees, and restoring a more natural hydrology. Since the
205 initial restoration, stewardship activities have focused on managing invasive plant
206 species. These efforts have been extremely successful both in improving the
207 natural habitat of the immediate area and providing a model for floodplain
208 restoration.

209

210 **Q. If the proposed transmission line is constructed on the Primary Route, what**
211 **effect will the construction have on the Spunky Bottoms Preserve?**

212 A. Heavy equipment needed for construction of the power line and associated
213 activities would directly and negatively impact restored natural habitats at Spunky
214 Bottoms, stressing and destroying native plants, both by design and as an
215 unintended by-product of the construction. Stresses to the natural plant
216 communities likely would contribute to invasions by undesirable plant species,
217 thereby requiring additional monitoring and additional remedial stewardship to
218 limit this secondary wave of damage. If established in the footprint of the
219 construction, invasive plants could threaten restored natural communities well
220 beyond the power lines. In addition, construction activities likely would disturb
221 the normal activities of many animal species, potentially leading to disruptions of
222 their life cycles, abandonment of the immediate construction area (and potentially
223 the entire Spunky Bottoms Preserve), and reduced fitness and even unnatural
224 mortalities. In short, construction of Ameren proposed Primary Route would
225 have significant immediate negative ecological impacts and likely would
226 undermine the core of the Spunky Bottoms restoration effort.

227

228 **Q. What effect would the existence of the power line on the Primary Route**
229 **have?**

230 A. In the long-term, the presence of the transmission line almost certainly would
231 transform the habitat in ways that undermine the floodplain restoration at Spunky

232 Bottom. Both the physical presence of the power line and the habitat
233 fragmentation that results will alter and/or disrupt some animals' behaviors and
234 contribute to decreased fitness and even unnatural mortality. As discussed above,
235 habitat fragmentation results in increased invasive plant species that are very
236 difficult to control. The plant species present will greatly influence the animal
237 species in their habitat selection. Although the footprint of the line and associated
238 easement may appear small, the effects of the line once constructed on the
239 preserve go well beyond the footprint.

240

241 **Q. If the proposed transmission line is constructed on the Primary Route, what**
242 **effect will the ongoing maintenance have on the Spunky Bottoms Preserve?**

243 A. Access for ongoing maintenance would disrupt normal activities of many animal
244 species, again with the potential of disrupting life cycles, causing abandonment of
245 the area and potentially the Preserve, and contributing directly or indirectly to
246 decreased fitness and even unnatural mortalities. Control of vegetation under the
247 lines would likely alter natural plant communities. Such alterations could
248 promote invasive species and could threaten native plant and animal communities
249 in the footprint, throughout the Spunky Bottoms Preserve and beyond.

250 Further, the presence of a high voltage power line running across the Spunky
251 Bottoms Preserve -- and the periodic maintenance that goes along with that --
252 would have a highly detrimental effect on the natural beauty and tranquility that
253 exists at Spunky Bottoms. Currently, in addition to being a property of high
254 ecological value as a home for numerous important animals and plants, the

255 Spunky Bottoms Preserve offers a highly valued setting for limited human
 256 activity, such as canoeing and kayaking, fishing, bird watching, and hiking. See,
 257 for example,

- 258 • [http://www.nature.org/ourinitiatives/regions/northamerica/unitedstates/illinois](http://www.nature.org/ourinitiatives/regions/northamerica/unitedstates/illinois/placesweprotect/spunky-bottoms.xml)
 259 [/placesweprotect/spunky-bottoms.xml](http://www.nature.org/ourinitiatives/regions/northamerica/unitedstates/illinois/placesweprotect/spunky-bottoms.xml); and
- 260 • [http://www.nature.org/ourinitiatives/habitats/riverslakes/placesweprotect/miss](http://www.nature.org/ourinitiatives/habitats/riverslakes/placesweprotect/mississippi-river-priority-site-spunky-bottoms.xml)
 261 [issippi-river-priority-site-spunky-bottoms.xml](http://www.nature.org/ourinitiatives/habitats/riverslakes/placesweprotect/mississippi-river-priority-site-spunky-bottoms.xml).

263 The construction, existence, and ongoing maintenance associated with a high
 264 voltage transmission line would be detrimental to these uses.

265

 267
 268
 269
 270
 271

III.

AMEREN'S PROPOSED PRIMARY ROUTE WOULD FRAGMENT BLUFF AND UPLAND HABITATS IMMEDIATELY ADJACENT TO THE SPUNKY BOTTOMS PRESERVE

272 **Q. Besides the Spunky Bottom Preserve land, are there other lands affected by**
 273 **Ameren's Primary Route in which The Nature Conservancy has a direct**
 274 **interest?**

275 A. Yes. The Nature Conservancy holds a conservation easement over about 90 acres
 276 of bluff and upland habitat immediately adjacent to the Spunky Bottoms Preserve.
 277 The current owners have reserved a life estate interest in the property, but have
 278 conveyed the remainder interest to The Nature Conservancy, which means that at
 279 their passing the property will become part of the Spunky Bottoms Preserve
 280 owned by The Nature Conservancy.

281

282 **Q. What is a conservation easement?**

283 A. A conservation easement is a nonpossessory interest in land in which the holder
284 (in this case, The Nature Conservancy) obtains the right to enforce certain
285 restrictions on the use of the land – restrictions that are intended to protect
286 identified conservation values. The conservation value of these particular 90
287 acres is stated as follows in the easement:

288 [T]he Protected Property consists of a series of remnant glacial till hill
289 prairies, limestone cliff plant and animal communities, and approximately
290 60 acres of grade B to C oak-hickory woodlands. Ten county record
291 reptile and amphibian species have been identified occupying the adjacent
292 Spunky Bottoms Preserve. Many of these species depend on limestone
293 cliff outcroppings as winter hibernaria habitat. The wooded bluff line also
294 serves as migration corridor for such species as red-shouldered hawk,
295 scarlet tanager, and northern parula, palm, yellow-rumped, hooded and
296 Kentucky warblers.

297
298 The conservation easement prohibits structures (including utility poles, towers,
299 conduits or lines), new roads, any nonagricultural commercial use, changes in
300 topography, removal of vegetation, subdivision, or any other use of the property
301 detrimental to water quality.

302

303 **Q. Why did The Nature Conservancy acquire the conservation easements that**
304 **are affected by Ameren’s Primary Route?**

305 A. The Nature Conservancy acquired the subject conservation easement to help
306 insure the long-term viability of the natural habitats and ecological processes and
307 the plant and animal communities they support on the lands subject to the
308 easement. Additionally, some of the animals that spend a portion of their lives on
309 the Spunky Bottoms Preserve need access to these upland and bluff habitats for
310 periods of their life histories. For example, these bluffs and uplands can be

311 important wintering areas for amphibians and reptiles that spend the rest of their
312 time in the wetlands on the Spunky Bottoms Preserve. Finally, those uplands
313 drain into Spunky Bottoms, and maintaining the integrity of those upland and
314 bluff areas will help insure the quality of water delivered to the Spunky Bottoms
315 Preserve. (See Smail, R.A. and D.J. Lewis, 2009. Forest Land Conversion,
316 Ecosystem Services, and Economic Issues for Policy: A Review, PNW-GTR 797,
317 USDA Forest Service, Pacific Northwest Research Station, Portland, OR.)

318

319 **Q. If the proposed transmission line is constructed on the Primary Route, what**
320 **effect will the construction have on the land subject to the conservation**
321 **easement held by The Nature Conservancy?**

322 A. As with the impacts of construction on the Spunky Bottoms Preserve itself, heavy
323 equipment needed for construction of the power lines and associated activities
324 would directly impact natural habitats on the lands subject to the conservation
325 easement, stressing or even destroying native plants whether by design (tree
326 removal) or as a by-product of the construction. Stresses to the natural plant
327 communities would likely contribute to invasions by undesirable plant and animal
328 species, thereby requiring additional monitoring and stewardship by The Nature
329 Conservancy Staff. If established in the footprint of the construction, invasive
330 plants and animals could threaten restored natural communities well beyond the
331 footprint of the power lines. Construction activities would likely disturb normal
332 activities of many animal species, potentially leading to disruptions of their life
333 cycles, abandonment of the construction area, and possibly contributing directly

334 or indirectly to reduced fitness and even unnatural mortalities. The physical
335 presence of the power lines will alter/disrupt some animals' behaviors and
336 contribute to decreased fitness and even mortality.

337

338 **Q. Is there any reason why the land subject to the conservation easement held**
339 **by The Nature Conservancy is more vulnerable to damage from construction**
340 **and ongoing maintenance and operation of the transmission line than other**
341 **land?**

342 A. Yes. The terrain of the easement land is much more variable than the wetland and
343 those soils are prone to erosion when native plant communities are disturbed.
344 Accordingly, erosion during construction and subsequent maintenance/operation
345 is a major concern. Erosion will impact not only the easement lands, but also the
346 Spunky Bottoms Preserve into which the easement lands drain. Similarly,
347 constructing and maintaining the power line through other bluff and upland
348 habitats would alter natural vegetation, increasing erosion and sediment delivered
349 to other floodplain wetlands between the bluffs and the river, thereby degrading
350 those wetlands and decreasing their values to nature and people.

351

352 **Q. If the proposed transmission line is constructed on the Primary Route, what**
353 **other effects will the ongoing maintenance have on the land subject to the**
354 **conservation easement held by The Nature Conservancy?**

355 A. As with maintenance of the power line on the Spunky Bottom Preserve, access for
356 ongoing maintenance would disrupt normal activities of many animal species,

357 again with the potential of disrupting life cycles, causing abandonment of the area
358 and contributing directly or indirectly to decreased fitness and even unnatural
359 mortalities. Control of vegetation under the lines would likely alter and fragment
360 natural plant communities. Such alterations could promote invasive species and
361 could threaten native plant and animal communities in the footprint and beyond.
362 For example, brood parasitism on forest nesting bird species would certainly
363 increase along the power line.

364
365 **IV.**

366
367 **AMEREN'S PROPOSED ROUTES**
368 **WOULD DEGRADE THE ILLINOIS**
369 **DEPARTMENT OF TRANSPORTATION'S LAGRANGE WETLAND**
370 **MITIGATION BANK AND SCHUYLER COUNTY BLUFF HABITAT**
371

372 **Q. Besides the Spunky Bottoms Preserve land and the adjacent conservation**
373 **easement land, is The Nature Conservancy interested in any other lands**
374 **affected by the proposed transmission line project?**

375 **A.** Yes. The Nature Conservancy has significant concerns regarding the preservation
376 and integrity of the Illinois Department of Transportation's LaGrange Wetland
377 Mitigation Bank located at in the north-eastern corner of Brown County. The
378 Nature Conservancy also is concerned about the extent to which Ameren's
379 Primary and Alternate Routes in the northern half of Schuyler County will
380 fragment important bluff habitat.

381

382 **Q. What concerns does The Nature Conservancy have regarding the**
383 **preservation and integrity of the Illinois Department of Transportation's**
384 **LaGrange Wetland Mitigation Bank?**

385 A. Ameren's proposed Alternate Route would intersect the Illinois Department of
386 Transportation's LaGrange Wetland Mitigation Bank. The wetland mitigation
387 bank site is especially significant both for its size and location. It is rare to find
388 over 1,600 acres of former floodplain that can be restored to natural hydrologic
389 function, thereby contributing to a more natural river hydrology with associated
390 reductions in flood damages -- that is, the wetland can retain water that would
391 otherwise flood farm fields and developed areas.

392 The wetland mitigation bank site also provides numerous other ecosystem
393 services including processing and recycling nutrients and sediments, improving
394 water quality, and affording important habitats for native plant and animal
395 species, and providing opportunities for education, research, recreation, and
396 compatible economic development. The wetland bank site was designated by the
397 Federal Highway Administration as an Exemplary Ecosystem Initiative in 2004.
398 (*See* <http://www.environment.fhwa.dot.gov/ecosystems/eei/eei04.asp>, accessed
399 March 28, 2013). The Direct Testimony of The Nature Conservancy witness Dr.
400 Jeff Walk explains how Ameren's proposed Alternate Route would undermine the
401 goals of the wetland mitigation bank. (*See* TNC Ex. 2.0 at 15-19.)

402

403 **Q. What concerns does The Nature Conservancy have regarding the impact**
404 **Ameren's proposed Primary and Alternate routes would have upon the bluff**
405 **habitat in Schuyler County?**

406 A. Ameren's Primary and Alternate Routes in the northern half of Schuyler County
407 would fragment important bluff habitat. The same likelihood of soil erosion,
408 invasive species spread, and stressors to the plant and animal communities
409 outlined for the Spunky Bottoms Preserve and conservation easement land would
410 apply to these bluff areas generally if the transmission line is constructed on those
411 routes. The main difference would be that soils would erode off the Schuyler
412 County bluffs mostly into channelized streams and ultimately, the Illinois River,
413 instead of into restored floodplain wetlands. As a result, there would be
414 additional adverse impacts upon overall water quality and the general ecology of
415 the Illinois River.

V.

CONCLUSION

421 **Q. In the context of determining public convenience and necessity, why should**
422 **the Commission care about the negative environmental effects that you have**
423 **outlined?**

424 A. As described above, functional floodplains provide numerous benefits for society.
425 Credible studies estimate the benefits provided by floodplain wetlands were equal
426 in value to \$19,580/hectare/year (\$7924/acre/year) -- greater than for any other
427 ecosystem type except marine estuaries. (See Robert Costanza, Ralph d'Arge,

428 Rudolf de Groot, Stephen Farberk, Monica Grasso, Bruce Hannon, Karin
429 Limburg, Shahid Naeem, Robert V. O'Neill, Jose Paruelo, Robert G. Raskin, Paul
430 Sutton & Marjan van den Belt. 1997. The value of the world's ecosystem
431 services and natural capital. NATURE, VOL 387) A 1994 study reported state
432 and federal agencies and permit seekers were willing to spend as much as
433 \$45,000/acre to \$124,000/acre (\$111,197 to \$306,410/hectare) in attempts to
434 restore services provided by freshwater wetlands. (See Dennis M. King and
435 Curtis Bohlen. 1994. Making Sense of Wetland Restoration Costs. University of
436 Maryland, Center for Environmental and Estuarine Studies, 1994.) When
437 reasonable alternative routes exist, the net societal costs of constructing and
438 maintaining the proposed power lines through functional floodplain wetlands
439 and/or through upland habitats that will result in degraded wetlands cannot be
440 justified.

441 In this case, there are viable alternatives that would avoid the Spunky Bottoms
442 Preserve and the IDOT Mitigation Bank. Those options are substantially
443 preferable to the Primary or Alternative Routes as initially proposed by Ameren.

444

445 **Q. Does this conclude your direct testimony?**

446 A. Yes.
